

The openxlsx2 book

Jan Marvin Garbuszus (JanMarvin) and openxlsx2 authors

Table of contents

Preface	5
1 Introduction	6
1.1 Installation	7
1.2 Working with the package	7
1.3 Example	8
1.4 Authors and contributions	9
1.5 License	9
1.6 A note on speed and memory usage	10
2 basics	11
2.1 Importing data	11
2.1.1 Basic import	11
2.1.2 colNames - first row as column name	12
2.1.3 detectDates - convert cells to R dates	13
2.1.4 showFormula - show formulas instead of results	13
2.1.5 dims - read specific dimension	14
2.1.6 cols - read selected columns	14
2.1.7 rows - read selected rows	15
2.1.8 convert - convert input to guessed type	15
2.1.9 skipEmptyRows - remove empty rows	15
2.1.10 skipEmptyCols - remove empty columns	16
2.1.11 rowNames - keep rownames from input	16
2.1.12 types - convert column to specific type	17
2.1.13 startRow - where to begin	17
2.1.14 na.strings - define missing values	18
2.1.15 Importing as workbook	18
2.2 Exporting data	19
2.2.1 Exporting data frames or vectors	19
2.2.2 Exporting <code>wbWorkbooks</code>	19
3 styling	20
3.1 Colors, text rotation and number formats	20
3.1.1 the quick way: using high level functions	20
3.1.2 the long way: using bare metal functions	21

4	Working with number formats	24
4.1	numfmts	24
4.2	numfmts2	24
5	Modifying the column widths	26
5.1	wb_set_col_widths	26
6	Adding borders	27
6.1	add borders	27
6.2	styled table	27
6.2.1	the quick way: using high level functions	28
6.2.2	the long way: creating everything from the bone	28
7	Use workbook colors and modify them	30
8	Copy cell styles	32
9	Style strings	33
10	Create custom table styles	34
11	Conditional Formatting	37
11.1	Rule applies to all each cell in range	37
11.2	Highlight row dependent on first cell in row	38
11.3	Highlight column dependent on first cell in column	39
11.4	Highlight entire range cols X rows dependent only on cell A1	40
11.5	Highlight cells in column 1 based on value in column 2	41
11.6	Highlight duplicates using default style	42
11.7	Cells containing text	42
11.8	Cells not containing text	43
11.9	Cells begins with text	44
11.10	Cells ends with text	44
11.11	Colorscale colors cells based on cell value	45
11.12	Databars	45
11.13	Between	49
11.14	Top N	50
11.15	Bottom N	51
11.16	Logical Operators	52
12	charts	53
12.1	Add plot to workbook	53
12.2	Add {ggplot2} plot to workbook	53
12.3	Add plot via {rvg}	54
12.4	Add {mschart} plots	55

Preface

This is a work in progress book describing the features of **openxlsx2** (Barbone and Garbuszus 2023). Having written a book before, I never imagined to do this again and therefore I shall not do it. But still I consider it a nice addition to have something more flexible as our **vignettes**.

1 Introduction

Unfortunately the entire business world is still built almost entirely on Microsofts Office tools and whenever data is involved, this means that is is largely built on the spreadsheet software Excel. R users that want to interact with this previously closed source file format had to rely on various packages. Packages that create workbook objects like `xlsx` (Dragulescu and Arendt 2023) and `openxlsx` (Schauberger and Walker 2023) and packages for special tasks namely `*readxl` (Wickham and Bryan 2023) and `writexl` (Ooms 2023), some are Windows exclusive interacting with Excel via a DCOM server `RDCOMClient` and `RExcel` ¹.

In Excel 2007 a new open standard called OOXML(short for office open xml)² which we will refer to as *openxml* was introduced. In December 2006 this standard was accepted by the ECMA and it subsequently replaced the previously used `xls` files wherever people are working with spreadsheet software (after all we are all aware that accounting does not really care whatever file format they are using as long as it opens up in their favorite spreadsheet software). The openxml standard introduced the so called Excel 2007 workbook format `xlsx`. These files are a collection of zipped XML-files. This makes is easy to import the files to R, because all you need is a tool to unzip the files and an XML-parser to import the files as data frames. Still, since there are various tasks available to interact with spreadsheet file, there are also various tools required. If all you want to do is read from files `readxl` is probably enough, if all you want to do is write `xlsx` files `writexl` is probably the fastest choice available. Yet there are a plethora of other tasks available and this book is about them.

The predecessor to `openxlsx2` (Barbone and Garbuszus 2023) called `openxlsx` (originally founded by Andrew Walker) was inspired by the `rJava` based `xlsx` package, but dropped the `rJava` dependency, and the support for the old `xls` files and wrote a custom XML parser in `Rcpp` (Eddelbuettel and François 2011). Later Phillip Schauburger picked up the abandoned `openxlsx` package and continues to maintain it. Finally `openxlsx2` was forked from `openxlsx` to include (1) the `pugixml` (Kapoulkine 2006-2022) library to address shortcomings of the `openxlsx` XML parser and (2) to switch to the `R6` (Chang 2021) package to introduce modern programming flows. Since then `openxlsx2` has evolved a lot, includes many new features and is approaching a stable API release 1.0. This manual is supposed to bundle and extend the existing vignettes and to document the changes.

¹See <https://github.com/omegahat/RDCOMClient>.

²See https://wikipedia.org/wiki/Office_Open_XML.

1.1 Installation

You can install the stable version of `openxlsx2` with:

```
install.packages('openxlsx2')
```

You can install the development version of `openxlsx2` from [GitHub](#) with:

```
# install.packages("remotes")
remotes::install_github("JanMarvin/openxlsx2")
```

Or from [r-universe](#) with:

```
# Enable repository from janmarvin
options(repos = c(
  janmarvin = 'https://janmarvin.r-universe.dev',
  CRAN = 'https://cloud.r-project.org'))
# Download and install openxlsx2 in R
install.packages('openxlsx2')
```

1.2 Working with the package

We offer two different variants how to work with `openxlsx2`.

- The first one is to simply work with R objects. It is possible to read (`read_xlsx()`) and write (`write_xlsx()`) data from and to files. We offer a number of options in the commands to support various features of the openxml format, including reading and writing named ranges and tables. Furthermore, there are several ways to read certain information of an openxml spreadsheet without having opened it in a spreadsheet software before, e.g. to get the contained sheet names or tables.
- As a second variant `openxlsx2` offers the work with so called `wbWorkbook` objects. Here an openxml file is read into a corresponding `wbWorkbook` object (`wb_load()`) or a new one is created (`wb_workbook()`). Afterwards the object can be further modified using various functions. For example, worksheets can be added or removed, the layout of cells or entire worksheets can be changed, and cells can be modified (overwritten or rewritten). Afterwards the `wbWorkbook` objects can be written as openxml files and processed by suitable spreadsheet software.

1.3 Example

This is a basic example which shows you how to solve a common problem:

```
library(openxlsx2)
# read xlsx or xlsxm files
path <- system.file("extdata/openxlsx2_example.xlsx", package = "openxlsx2")
read_xlsx(path)
```

	Var1	Var2	NA	Var3	Var4	Var5	Var6	Var7	Var8
3	TRUE	1	NA	1	a	2023-05-29 3209324	This	#DIV/0!	01:27:15

```
# and save
temp <- temp_xlsx()
if (interactive()) wb_save(wb, temp)

## or create one yourself
wb <- wb_workbook()
# add a worksheet
wb$add_worksheet("sheet")
# add some data
wb$add_data("sheet", cars)
# open it in your default spreadsheet software
if (interactive()) wb$open()
```

1.4 Authors and contributions

For a full list of all authors that have made this package possible and for whom we are grateful, please see:

```
system.file("AUTHORS", package = "openxlsx2")
```

If you feel like you should be included on this list, please let us know. If you have something to contribute, you are welcome. If something is not working as expected, open issues or if you have solved an issue, open a pull request. Please be respectful and be aware that we are volunteers doing this for fun in our unpaid free time. We will work on problems when we have time or need.

1.5 License

The `openxlsx2` package is licensed under the MIT license and is based on `openxlsx` (by Alexander Walker and Philipp Schauburger; COPYRIGHT 2014-2022) and `pugixml` (by Arseny Kapoulkine; COPYRIGHT 2006-2022). Both released under the MIT license.

1.6 A note on speed and memory usage

The current state of `openxlsx2` is that it is reasonably fast. That is, it works well with reasonably large input data when reading or writing. It may not work well with data that tests the limits of the openxml specification. Things may slow down on the R side of things, and performance and usability will depend on the speed and size of the local operating system's CPU and memory.

Note that there are at least two cases where `openxlsx2` constructs potentially large data frames (i) when loading, `openxlsx2` usually needs to read the entire input file into pugixml and convert it into long data frame(s), and `wb_to_df()` converts one long data frame into two data frames that construct the output object and (ii) when adding data to the workbook, `openxlsx2` reshapes the input data frame into a long data frame and stores it in the workbook, and writes the entire worksheet into a pugixml file that is written when it is complete. Applying cell styles, date conversions etc. will further slow down the process and finally the sheets will be zipped to provide the xlsx output.

Therefore, if you are faced with an unreasonably large dataset, either give yourself enough time, use another package to write the xlsx output (`openxlsx2` was not written with the intention of working with maximum memory efficiency), and by all means use other ways to store data (binary file formats or a database). However, we are always happy to improve, so if you have found a way to improve what we are currently doing, please let us know and open an issue or a pull request.

2 basics

Welcome to the basic manual to `openxlsx2`. In this manual you will learn how to use `openxlsx2` to import data from `xlsx`-files to R as well as how to export data from R to `xlsx`, and how to import and modify these `openxml` workbooks in R. This package is based on the work of many contributors to `openxlsx`. It was mostly rewritten using `pugixml` and `R6` making use of modern technology, providing a fresh and easy to use R package.

Over the years many people have worked on the tricky task to handle `xls` and `xlsx` files. Notably `openxlsx`, but there are countless other R-packages as well as third party libraries or calculation software capable of handling such files. Please feel free to use and test your files with other software and or let us know about your experience. Open an issue on github or write us a mail.

2.1 Importing data

Coming from `openxlsx` you might know about `read.xlsx()` (two functions, one for files and one for workbooks) and `readWorkbook()`. Functions that do different things, but mostly the same. In `openxlsx2` we tried our best to reduce the complexity under the hood and for the user as well. In `openxlsx2` they are replaced with `read_xlsx()`, `wb_read()` and they share the same underlying function `wb_to_df()`.

For this example we will use example data provided by the package. You can locate it in our “inst/extdata” folder. The files are included with the package source and you can open them in any calculation software as well.

2.1.1 Basic import

We begin with the `readTest.xlsx` file by telling R where to find this file on our system

```
xlsxFile <- system.file("extdata", "openxlsx2_example.xlsx", package = "openxlsx2")
```

The object contains a path to the `xlsx` file and we pass this file to our function to read the workbook into R

```
# import workbook
wb_to_df(xlsxFile)
#>      Var1 Var2 NA  Var3  Var4      Var5      Var6      Var7      Var8
#> 3   TRUE   1 NA    1     a 2023-05-29 3209324 This #DIV/0! 01:27:15
#> 4   TRUE  NA NA  #NUM!    b 2023-05-23      <NA>      0 14:02:57
#> 5   TRUE   2 NA   1.34    c 2023-02-01      <NA> #VALUE! 23:01:02
#> 6  FALSE   2 NA  <NA> #NUM!      <NA>      <NA>      2 17:24:53
#> 7  FALSE   3 NA   1.56    e      <NA>      <NA>      <NA>
#> 8  FALSE   1 NA   1.7    f 2023-03-02      <NA>      2.7 08:45:58
#> 9    NA  NA NA  <NA>  <NA>      <NA>      <NA>      <NA>
#> 10 FALSE   2 NA    23    h 2023-12-24      <NA>      25      <NA>
#> 11 FALSE   3 NA   67.3    i 2023-12-25      <NA>      3      <NA>
#> 12    NA   1 NA   123  <NA> 2023-07-31      <NA>     122      <NA>
```

The output is created as a data frame and contains data types date, logical, numeric and character. The function to import the file to R, `wb_to_df()` provides similar options as the `openxlsx` functions `read.xlsx()` and `readWorkbook()` and a few new functions we will go through the options. As you might have noticed, we return the column of the xlsx file as the row name of the data frame returned. Per default the first sheet in the workbook is imported. If you want to switch this, either provide the `sheet` parameter with the correct index or provide the sheet name.

2.1.2 colNames - first row as column name

In the previous example the first imported row was used as column name for the data frame. This is the default behavior, but not always wanted or expected. Therefore this behavior can be disabled by the user.

```
# do not convert first row to colNames
wb_to_df(xlsxFile, colNames = FALSE)
#>      B    C D    E    F      G      H      I      J
#> 2    NA Var2 NA  Var3  Var4      Var5      Var6      Var7      Var8
#> 3   TRUE   1 NA    1     a 2023-05-29 3209324 This #DIV/0! 01:27:15
#> 4   TRUE <NA> NA  #NUM!    b 2023-05-23      <NA>      0 14:02:57
#> 5   TRUE   2 NA   1.34    c 2023-02-01      <NA> #VALUE! 23:01:02
#> 6  FALSE   2 NA  <NA> #NUM!      <NA>      <NA>      2 17:24:53
#> 7  FALSE   3 NA   1.56    e      <NA>      <NA>      <NA>
#> 8  FALSE   1 NA   1.7    f 2023-03-02      <NA>      2.7 08:45:58
#> 9    NA <NA> NA  <NA>  <NA>      <NA>      <NA>      <NA>
#> 10 FALSE   2 NA    23    h 2023-12-24      <NA>      25      <NA>
#> 11 FALSE   3 NA   67.3    i 2023-12-25      <NA>      3      <NA>
```

```
#> 12      NA      1 NA      123 <NA> 2023-07-31      <NA>      122      <NA>
```

2.1.3 detectDates - convert cells to R dates

The creators of the openxml standard are well known for mistakenly treating something as a date and `openxlsx2` has built in ways to identify a cell as a date and will try to convert the value for you, but unfortunately this is not always a trivial task and might fail. In such a case we provide an option to disable the date conversion entirely. In this case the underlying numerical value will be returned.

```
# do not try to identify dates in the data
wb_to_df(xlsxFile, detectDates = FALSE)
#>      Var1 Var2 NA  Var3  Var4  Var5      Var6  Var7      Var8
#> 3  TRUE      1 NA      1      a 45075 3209324 This #DIV/0! 0.06059028
#> 4  TRUE      NA NA #NUM!      b 45069      <NA>      0 0.58538194
#> 5  TRUE      2 NA  1.34      c 44958      <NA> #VALUE! 0.95905093
#> 6 FALSE      2 NA  <NA> #NUM!      NA      <NA>      2 0.72561343
#> 7 FALSE      3 NA  1.56      e      NA      <NA>      <NA>      NA
#> 8 FALSE      1 NA  1.7      f 44987      <NA>      2.7 0.36525463
#> 9      NA      NA NA  <NA>  <NA>      NA      <NA>      <NA>      NA
#> 10 FALSE      2 NA      23      h 45284      <NA>      25      NA
#> 11 FALSE      3 NA  67.3      i 45285      <NA>      3      NA
#> 12      NA      1 NA      123 <NA> 45138      <NA>      122      NA
```

2.1.4 showFormula - show formulas instead of results

Sometimes things might feel off. This can be because the openxml files are not updating formula results in the sheets unless they are opened in software that provides such functionality as certain tabular calculation software. Therefore the user might be interested in the underlying functions to see what is going on in the sheet. Using `showFormula` this is possible

```
# return the underlying Excel formula instead of their values
wb_to_df(xlsxFile, showFormula = TRUE)
#>      Var1 Var2 NA  Var3  Var4      Var5      Var6      Var7      Var8
#> 3  TRUE      1 NA      1      a 2023-05-29 3209324 This      E3/0 01:27:15
#> 4  TRUE      NA NA #NUM!      b 2023-05-23      <NA>      C4 14:02:57
#> 5  TRUE      2 NA  1.34      c 2023-02-01      <NA>      #VALUE! 23:01:02
#> 6 FALSE      2 NA  <NA> #NUM!      <NA>      <NA>      C6+E6 17:24:53
#> 7 FALSE      3 NA  1.56      e      <NA>      <NA>      <NA>      <NA>
#> 8 FALSE      1 NA  1.7      f 2023-03-02      <NA>      C8+E8 08:45:58
```

```
#> 9      NA      NA NA <NA> <NA> <NA> <NA> <NA> <NA>
#> 10 FALSE      2 NA      23      h 2023-12-24 <NA> SUM(C10,E10) <NA>
#> 11 FALSE      3 NA     67.3      i 2023-12-25 <NA> PRODUCT(C11,E3) <NA>
#> 12      NA      1 NA     123 <NA> 2023-07-31 <NA> E12-C12 <NA>
```

2.1.5 dims - read specific dimension

Sometimes the entire worksheet contains too much data, in such case we provide functions to read only a selected dimension range. Such a range consists of either a specific cell like “A1” or a cell range in the notation used in the openxml standard

```
# read dimension without colNames
wb_to_df(xlsxFile, dims = "A2:C5", colNames = FALSE)
#>   A      B      C
#> 2 NA      NA Var2
#> 3 NA TRUE      1
#> 4 NA TRUE <NA>
#> 5 NA TRUE      2
```

2.1.6 cols - read selected columns

If you do not want to read a specific cell, but a cell range you can use the column attribute. This attribute takes a numeric vector as argument

```
# read selected cols
wb_to_df(xlsxFile, cols = c("A:B", "G"))
#>   NA Var1      Var5
#> 3 NA TRUE 2023-05-29
#> 4 NA TRUE 2023-05-23
#> 5 NA TRUE 2023-02-01
#> 6 NA FALSE <NA>
#> 7 NA FALSE <NA>
#> 8 NA FALSE 2023-03-02
#> 9 NA      NA <NA>
#> 10 NA FALSE 2023-12-24
#> 11 NA FALSE 2023-12-25
#> 12 NA      NA 2023-07-31
```

2.1.7 rows - read selected rows

The same goes with rows. You can select them using numeric vectors

```
# read selected rows
wb_to_df(xlsxFile, rows = c(2, 4, 6))
#>   Var1 Var2 NA  Var3  Var4      Var5 Var6 Var7      Var8
#> 4  TRUE  NA NA #NUM!      b 2023-05-23  NA   0 14:02:57
#> 6 FALSE   2 NA <NA> #NUM!      <NA>  NA   2 17:24:53
```

2.1.8 convert - convert input to guessed type

In xml exists no difference between value types. All values are per default characters. To provide these as numerics, logicals or dates, `openxlsx2` and every other software dealing with xlsx files has to make assumptions about the cell type. This is especially tricky due to the notion of worksheets. Unlike in a data frame, a worksheet can have a wild mix of all types of data. Even though the conversion process from character to date or numeric is rather solid, sometimes the user might want to see the data without any conversion applied. This might be useful in cases where something unexpected happened or the import created warnings. In such a case you can look at the raw input data. If you want to disable date detection as well, please see the entry above.

```
# convert characters to numerics and date (logical too?)
wb_to_df(xlsxFile, convert = FALSE)
#>   Var1 Var2  NA  Var3  Var4      Var5      Var6      Var7      Var8
#> 3  TRUE   1 <NA>    1      a 2023-05-29 3209324 This #DIV/0! 01:27:15
#> 4  TRUE <NA> <NA> #NUM!    b 2023-05-23      <NA>    0 14:02:57
#> 5  TRUE   2 <NA>  1.34    c 2023-02-01      <NA> #VALUE! 23:01:02
#> 6 FALSE   2 <NA> <NA> #NUM!      <NA>      <NA>    2 17:24:53
#> 7 FALSE   3 <NA>  1.56    e      <NA>      <NA>    <NA>    <NA>
#> 8 FALSE   1 <NA>  1.7    f 2023-03-02      <NA>    2.7 08:45:58
#> 9  <NA> <NA> <NA> <NA> <NA>      <NA>    <NA>    <NA>
#> 10 FALSE   2 <NA>   23    h 2023-12-24      <NA>    25    <NA>
#> 11 FALSE   3 <NA>  67.3   i 2023-12-25      <NA>    3    <NA>
#> 12 <NA>   1 <NA>  123   <NA> 2023-07-31      <NA>   122    <NA>
```

2.1.9 skipEmptyRows - remove empty rows

Even though `openxlsx2` imports everything as requested, sometimes it might be helpful to remove empty lines from the data. These might be either left empty intentional or empty because they were formatted, but the cell value was removed afterwards. This was added

mostly for backward comparability, but the default has been changed to **FALSE**. The behavior has changed a bit as well. Previously empty cells were removed prior to the conversion to R data frames, now they are removed after the conversion and are removed only if they are completely empty

```
# erase empty Rows from dataset
wb_to_df(xlsxFile, sheet = 1, skipEmptyRows = TRUE) |> tail()
#>      Var1 Var2 NA Var3  Var4      Var5 Var6 Var7      Var8
#> 6 FALSE    2 NA <NA> #NUM!    <NA> <NA>    2 17:24:53
#> 7 FALSE    3 NA 1.56    e    <NA> <NA> <NA>    <NA>
#> 8 FALSE    1 NA 1.7    f 2023-03-02 <NA>    2.7 08:45:58
#> 10 FALSE    2 NA 23    h 2023-12-24 <NA>    25    <NA>
#> 11 FALSE    3 NA 67.3    i 2023-12-25 <NA>    3    <NA>
#> 12    NA    1 NA 123 <NA> 2023-07-31 <NA>   122    <NA>
```

2.1.10 skipEmptyCols - remove empty columns

The same for columns

```
# erase empty Cols from dataset
wb_to_df(xlsxFile, skipEmptyCols = TRUE)
#>      Var1 Var2  Var3  Var4      Var5      Var6  Var7      Var8
#> 3  TRUE    1    1    a 2023-05-29 3209324 This #DIV/0! 01:27:15
#> 4  TRUE   NA #NUM!    b 2023-05-23    <NA>    0 14:02:57
#> 5  TRUE    2 1.34    c 2023-02-01    <NA> #VALUE! 23:01:02
#> 6 FALSE    2 <NA> #NUM!    <NA>    <NA>    2 17:24:53
#> 7 FALSE    3 1.56    e    <NA>    <NA>    <NA>    <NA>
#> 8 FALSE    1 1.7    f 2023-03-02    <NA>    2.7 08:45:58
#> 9    NA   NA <NA> <NA>    <NA>    <NA>    <NA>    <NA>
#> 10 FALSE    2    23    h 2023-12-24    <NA>    25    <NA>
#> 11 FALSE    3 67.3    i 2023-12-25    <NA>    3    <NA>
#> 12    NA    1 123 <NA> 2023-07-31    <NA>   122    <NA>
```

2.1.11 rowNames - keep rownames from input

Sometimes the data source might provide rownames as well. In such a case you can `openxlsx2` to treat the first column as rowname

```
# convert first row to rownames
wb_to_df(xlsxFile, sheet = 2, dims = "C6:G9", rowNames = TRUE)
```

```
#>           mpg cyl disp  hp
#> Mazda RX4      21.0   6  160 110
#> Mazda RX4 Wag  21.0   6  160 110
#> Datsun 710      22.8   4  108  93
```

2.1.12 types - convert column to specific type

If the user know better than the software what type to expect in a worksheet, this can be provided via types. This parameter takes a named numeric. 0 is character, 1 is numeric and 2 is date

```
# define type of the data.frame
wb_to_df(xlsxFile, cols = c(2, 5), types = c("Var1" = 0, "Var3" = 1))
#>      Var1  Var3
#> 3  TRUE  1.00
#> 4  TRUE   NaN
#> 5  TRUE  1.34
#> 6 FALSE   NA
#> 7 FALSE  1.56
#> 8 FALSE  1.70
#> 9  <NA>   NA
#> 10 FALSE 23.00
#> 11 FALSE 67.30
#> 12 <NA> 123.00
```

2.1.13 startRow - where to begin

Often the creator of the worksheet has used a lot of creativity and the data does not begin in the first row, instead it begins somewhere else. To define the row where to begin reading, define it via the **startRow** parameter

```
# start in row 5
wb_to_df(xlsxFile, startRow = 5, colNames = FALSE)
#>      B C D      E      F      G H      I      J
#> 5  TRUE 2 NA  1.34      c 2023-02-01 NA #VALUE! 23:01:02
#> 6 FALSE 2 NA      NA #NUM!      <NA> NA      2 17:24:53
#> 7 FALSE 3 NA  1.56      e      <NA> NA      <NA>      <NA>
#> 8 FALSE 1 NA  1.70      f 2023-03-02 NA      2.7 08:45:58
#> 9      NA NA NA      NA <NA>      <NA> NA      <NA>      <NA>
#> 10 FALSE 2 NA 23.00      h 2023-12-24 NA      25      <NA>
```

```
#> 11 FALSE 3 NA 67.30 i 2023-12-25 NA 3 <NA>
#> 12 NA 1 NA 123.00 <NA> 2023-07-31 NA 122 <NA>
```

2.1.14 na.strings - define missing values

There is the “#N/A” string, but often the user will be faced with custom missing values and other values we are not interested. Such strings can be passed as character vector via `na.strings`

```
# na string
wb_to_df(xlsxFile, na.strings = "")
#>      Var1 Var2 NA  Var3  Var4      Var5      Var6      Var7      Var8
#> 3   TRUE   1 NA    1     a 2023-05-29 3209324 This #DIV/0! 01:27:15
#> 4   TRUE  NA NA  #NUM!    b 2023-05-23      <NA>      0 14:02:57
#> 5   TRUE   2 NA   1.34    c 2023-02-01      <NA> #VALUE! 23:01:02
#> 6  FALSE   2 NA  <NA> #NUM!      <NA>      <NA>      2 17:24:53
#> 7  FALSE   3 NA   1.56    e      <NA>      <NA> <NA>      <NA>
#> 8  FALSE   1 NA   1.7    f 2023-03-02      <NA>      2.7 08:45:58
#> 9    NA  NA NA  <NA> <NA>      <NA>      <NA> <NA>      <NA>
#> 10 FALSE   2 NA   23    h 2023-12-24      <NA>      25      <NA>
#> 11 FALSE   3 NA   67.3    i 2023-12-25      <NA>      3      <NA>
#> 12   NA   1 NA   123  <NA> 2023-07-31      <NA>     122      <NA>
```

2.1.15 Importing as workbook

In addition to importing directly from xlsx or xlsx files, `openxlsx2` provides the `wbWorkbook` class used for importing and modifying entire the openxml files in R. This `workbook` class is the heart of `openxlsx2` and probably the reason why you are reading this manual in the first place.

Importing a file into a workbook looks like this:

```
# the file we are going to load
xlsxFile <- system.file("extdata", "openxlsx2_example.xlsx", package = "openxlsx2")
# loading the file into the workbook
wb <- wb_load(file = xlsxFile)
```

The additional options `wb_load()` provides are for internal use: `sheet` loads only a selected sheet from the workbook and `data_only` reads only the data parts from a workbook and ignores any additional graphics or pivot tables. Both functions create workbook objects that

can only be used to read data, and we do not recommend end users to use them. Especially not if they intend to re-export the workbook afterwards.

Once a workbook is imported, we provide several functions to interact with and modify it (the `wb_to_df()` function mentioned above works the same way for an imported workbook). It is possible to add new sheets and remove sheets, as well as to add or remove data. R-plots can be inserted and also the style of the workbook can be changed, new fonts, background colors and number formats. There is a wealth of options explained in the man pages and the additional style vignette (more vignettes to follow).

2.2 Exporting data

2.2.1 Exporting data frames or vectors

If you want to export a data frame from R, you can use `write_xlsx()` which will create an xlsx file. This file can be tweaked further. The man page provides various options (further explanation and examples will follow).

```
write_xlsx(mtcars, "mtcars.xlsx")
```

2.2.2 Exporting wbWorkbooks

Imported workbooks can be saved as xlsx or xlsx files with the wrapper `wb_save()` or with `wb$save()`. Both functions take the filename and an optional `Overwrite` option. If the latter is set, an optional guard is provided to check if the file you want to write already exists. But be careful, this is optional. The default is to save the file and replace an existing file. Of course, in Windows, files that are locked (for example, if they were opened by another process) will not be replaced.

```
# replace the existing file
wb$save("mtcars.xlsx")

# do not overwrite the existing file
try(wb$save("mtcars.xlsx", overwrite = FALSE))
```

3 styling

Welcome to the styling manual for **openxlsx2**. In this manual you will learn how to use **openxlsx2** to style your worksheets. data from xlsx-files to R as well as how to export data from R to xlsx, and how to import and modify these openxml workbooks in R.

3.1 Colors, text rotation and number formats

Below we show you two ways how to create styled tables with **openxlsx2** one using the high level functions to style worksheet areas and one using the bare metal approach of creating the identical table. We show both ways to create styles in **openxlsx2** to show how you could build on our functions or create your very own functions.

Figure 3.1: The example below, with increased column width.

3.1.1 the quick way: using high level functions

```
# add some dummy data
set.seed(123)
mat <- matrix(rnorm(28 * 28, mean = 44444, sd = 555), ncol = 28)
colnames(mat) <- make.names(seq_len(ncol(mat)))
border_col <- wb_color(theme = 1)
border_sty <- "thin"
```

```

# prepare workbook with data and formatted first row
wb <- wb_workbook() %>%
  wb_add_worksheet("test") %>%
  wb_add_data(x = mat) %>%
  wb_add_border(dims = "A1:AB1",
    top_color = border_col, top_border = border_sty,
    bottom_color = border_col, bottom_border = border_sty,
    left_color = border_col, left_border = border_sty,
    right_color = border_col, right_border = border_sty,
    inner_hcolor = border_col, inner_hgrid = border_sty
  ) %>%
  wb_add_fill(dims = "A1:AB1", color = wb_color(hex = "FF334E6F")) %>%
  wb_add_font(dims = "A1:AB1", name = "Arial", bold = TRUE, color = wb_color(hex = "FFFFFFF")) %>%
  wb_add_cell_style(dims = "A1:AB1", horizontal = "center", textRotation = 45)

# create various number formats
x <- c(
  0, 1, 2, 3, 4, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22,
  37, 38, 39, 40, 45, 46, 47, 48, 49
)

# apply the styles
for (i in seq_along(x)) {
  cell <- sprintf("%s2:%s29", int2col(i), int2col(i))
  wb <- wb %>% wb_add_numfmt(dims = cell, numfmt = x[i])
}

# wb$open()

```

3.1.2 the long way: using bare metal functions

```

# create workbook
wb <- wb_workbook() %>% wb_add_worksheet("test")

# add some dummy data to the worksheet
set.seed(123)
mat <- matrix(rnorm(28 * 28, mean = 44444, sd = 555), ncol = 28)
colnames(mat) <- make.names(seq_len(ncol(mat)))
wb$add_data(x = mat, colNames = TRUE)

```

```

# create a border style and assign it to the workbook
black <- wb_color(hex = "FF000000")
new_border <- create_border(
  bottom = "thin", bottom_color = black,
  top = "thin", top_color = black,
  left = "thin", left_color = black,
  right = "thin", right_color = black
)
wb$styles_mgr$add(new_border, "new_border")

# create a fill style and assign it to the workbook
new_fill <- create_fill(patternType = "solid", fgColor = wb_color(hex = "FF334E6F"))
wb$styles_mgr$add(new_fill, "new_fill")

# create a font style and assign it to the workbook
new_font <- create_font(sz = 20, name = "Arial", b = TRUE, color = wb_color(hex = "FFFFFFF"))
wb$styles_mgr$add(new_font, "new_font")

# create a new cell style, that uses the fill, the font and the border style
new_cellxfs <- create_cell_style(
  numFmtId = 0,
  horizontal = "center",
  textRotation = 45,
  fillId = wb$styles_mgr$get_fill_id("new_fill"),
  fontId = wb$styles_mgr$get_font_id("new_font"),
  borderId = wb$styles_mgr$get_border_id("new_border")
)
# assign this style to the workbook
wb$styles_mgr$add(new_cellxfs, "new_styles")

# assign the new cell style to the header row of our data set
cell <- sprintf("A1:%s1", int2col(nrow(mat)))
wb <- wb %>% wb_set_cell_style(
  dims = cell,
  style = wb$styles_mgr$get_xf_id("new_styles")
)

## style the cells with some builtin format codes (no new numFmt entry is needed)
# add builtin style ids
x <- c(

```

```

1, 2, 3, 4, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22,
37, 38, 39, 40, 45, 46, 47, 48, 49
)

# create styles
new_cellxfs <- create_cell_style(numFmtId = x, horizontal = "center")

# assign the styles to the workbook
for (i in seq_along(x)) {
  wb$styles_mgr$add(new_cellxfs[i], paste0("new_style", i))
}

# new styles are 1:28
new_styles <- wb$styles_mgr$get_xf()
for (i in as.integer(new_styles$id[new_styles$name %in% paste0("new_style", seq_along(x))])
  cell <- sprintf("%s2:%s29", int2col(i), int2col(i))
  wb <- wb %>% wb_set_cell_style(dims = cell, style = i)
}

# assign a custom tabColor
wb$worksheets[[1]]$sheetPr <- xml_node_create(
  "sheetPr",
  xml_children = xml_node_create(
    "tabColor",
    xml_attributes = wb_color(hex = "FF00FF00")
  )
)

# # look at the beauty you've created
# wb_open(wb)

```

4 Working with number formats

Per default `openxlsx2` will pick up number formats for selected R classes.

4.1 numfmts

```
## Create Workbook object and add worksheets
wb <- wb_workbook()
wb$add_worksheet("S1")
wb$add_worksheet("S2")

df <- data.frame(
  "Date" = Sys.Date() - 0:19,
  "T" = TRUE, "F" = FALSE,
  "Time" = Sys.time() - 0:19 * 60 * 60,
  "Cash" = paste("$", 1:20), "Cash2" = 31:50,
  "hLink" = "https://CRAN.R-project.org/",
  "Percentage" = seq(0, 1, length.out = 20),
  "TinyNumbers" = runif(20) / 1E9, stringsAsFactors = FALSE
)

## openxlsx will apply default Excel styling for these classes
class(df$Cash) <- c(class(df$Cash), "currency")
class(df$Cash2) <- c(class(df$Cash2), "accounting")
class(df$hLink) <- "hyperlink"
class(df$Percentage) <- c(class(df$Percentage), "percentage")
class(df$TinyNumbers) <- c(class(df$TinyNumbers), "scientific")

wb$add_data("S1", x = df, startRow = 4, rowNames = FALSE)
wb$add_data_table("S2", x = df, startRow = 4, rowNames = FALSE)
```

4.2 numfmts2

In addition, you can set the style to be picked up using `openxlsx2` options.

```

wb <- wb_workbook()
wb <- wb_add_worksheet(wb, "test")

options("openxlsx2.dateFormat" = "yyyy")
options("openxlsx2.datetimeFormat" = "yyyy-mm-dd")
options("openxlsx2.numFmt" = "€ #.0")

df <- data.frame(
  "Date" = Sys.Date() - 0:19,
  "T" = TRUE, "F" = FALSE,
  "Time" = Sys.time() - 0:19 * 60 * 60,
  "Cash" = paste("$", 1:20), "Cash2" = 31:50,
  "hLink" = "https://CRAN.R-project.org/",
  "Percentage" = seq(0, 1, length.out = 20),
  "TinyNumbers" = runif(20) / 1E9, stringsAsFactors = FALSE,
  "numeric" = 1
)

## openxlsx will apply default Excel styling for these classes
class(df$Cash) <- c(class(df$Cash), "currency")
class(df$Cash2) <- c(class(df$Cash2), "accounting")
class(df$hLink) <- "hyperlink"
class(df$Percentage) <- c(class(df$Percentage), "percentage")
class(df$TinyNumbers) <- c(class(df$TinyNumbers), "scientific")

wb$add_data("test", df)

```

5 Modifying the column widths

5.1 `wb_set_col_widths`

```
wb <- wb_workbook() %>%  
  wb_add_worksheet() %>%  
  wb_add_data(x = mtcars, rowNames = TRUE)  
  
cols <- 1:12  
wb <- wb %>% wb_set_col_widths(cols = cols, widths = "auto")
```

6 Adding borders

6.1 add borders

```
wb <- wb_workbook()
# full inner grid
wb$add_worksheet("S1", gridLines = FALSE)$add_data(x = mtcars)
wb$add_border(
  dims = "A2:K33",
  inner_hgrid = "thin", inner_hcolor = wb_color(hex = "FF808080"),
  inner_vgrid = "thin", inner_vcolor = wb_color(hex = "FF808080")
)
# only horizontal grid
wb$add_worksheet("S2", gridLines = FALSE)$add_data(x = mtcars)
wb$add_border(dims = "A2:K33", inner_hgrid = "thin", inner_hcolor = wb_color(hex = "FF808080"))
# only vertical grid
wb$add_worksheet("S3", gridLines = FALSE)$add_data(x = mtcars)
wb$add_border(dims = "A2:K33", inner_vgrid = "thin", inner_vcolor = wb_color(hex = "FF808080"))
# no inner grid
wb$add_worksheet("S4", gridLines = FALSE)$add_data(x = mtcars)
wb$add_border("S4", dims = "A2:K33")
```

6.2 styled table

Below we show you two ways how to create styled tables with `openxlsx2` one using the high level functions to style worksheet areas and one using the bare metal approach of creating the identical table.

X1	X2
1	3
2	4

6.2.1 the quick way: using high level functions

```
# add some dummy data to the worksheet
mat <- matrix(1:4, ncol = 2, nrow = 2)
colnames(mat) <- make.names(seq_len(ncol(mat)))

wb <- wb_workbook() %>%
  wb_add_worksheet("test") %>%
  wb_add_data(x = mat, colNames = TRUE, startCol = 2, startRow = 2) %>%
  # center first row
  wb_add_cell_style(dims = "B2:C2", horizontal = "center") %>%
  # add border for first row
  wb_add_border(
    dims = "B2:C2",
    bottom_color = wb_color(theme = 1), bottom_border = "thin",
    top_color = wb_color(theme = 1), top_border = "double",
    left_border = NULL, right_border = NULL
  ) %>%
  # add border for last row
  wb_add_border(
    dims = "B4:C4",
    bottom_color = wb_color(theme = 1), bottom_border = "double",
    top_border = NULL, left_border = NULL, right_border = NULL
  )
```

6.2.2 the long way: creating everything from the bone

```
# add some dummy data to the worksheet
mat <- matrix(1:4, ncol = 2, nrow = 2)
colnames(mat) <- make.names(seq_len(ncol(mat)))

wb <- wb_workbook() %>%
  wb_add_worksheet("test") %>%
  wb_add_data(x = mat, startCol = 2, startRow = 2)

# create a border style and assign it to the workbook
black <- wb_color(hex = "FF000000")
top_border <- create_border(
  top = "double", top_color = black,
  bottom = "thin", bottom_color = black
```

```

)

bottom_border <- create_border(bottom = "double", bottom_color = black)

wb$styles_mgr$add(top_border, "top_border")
wb$styles_mgr$add(bottom_border, "bottom_border")

# create a new cell style, that uses the fill, the font and the border style
top_cellxfs <- create_cell_style(
  numFmtId = 0,
  horizontal = "center",
  borderId = wb$styles_mgr$get_border_id("top_border")
)
bottom_cellxfs <- create_cell_style(
  numFmtId = 0,
  borderId = wb$styles_mgr$get_border_id("bottom_border")
)

# assign this style to the workbook
wb$styles_mgr$add(top_cellxfs, "top_styles")
wb$styles_mgr$add(bottom_cellxfs, "bottom_styles")

# assign the new cell style to the header row of our data set
cell <- "B2:C2"
wb <- wb %>% wb_set_cell_style(dims = cell, style = wb$styles_mgr$get_xf_id("top_styles"))
cell <- "B4:C4"
wb <- wb %>% wb_set_cell_style(dims = cell, style = wb$styles_mgr$get_xf_id("bottom_styles"))

```

7 Use workbook colors and modify them

The loop below will apply the tint attribute to the fill color

Figure 7.1: Tint variations of the theme colors.

```
wb <- wb_workbook() %>% wb_add_worksheet("S1")

tints <- seq(-0.9, 0.9, by = 0.1)

for (i in 0:9) {
  for (tnt in tints) {
    col <- paste0(int2col(i + 1), which(tints %in% tnt))

    if (tnt == 0) {
      wb <- wb %>% wb_add_fill(dims = col, color = wb_color(theme = i))
    } else {
```

```
    wb <- wb %>% wb_add_fill(dims = col, color = wb_color(theme = i, tint = tint))  
  }  
}  
}
```

8 Copy cell styles

It is possible to copy the styles of several cells at once. In the following example, the styles of some cells from a formatted workbook are applied to a previously empty cell range. Be careful though, `wb_get_cell_style()` returns only some styles, so you have to make sure that the copy-from and copy-to dimensions match in a meaningful way.

```
wb <- wb_load(system.file("extdata", "xlsx2_sheet.xlsx", package = "openxlsx2")) %>%  
  wb_set_cell_style(1, "A30:G35", wb_get_cell_style(., 1, "A10:G15"))  
# wb_open(wb)
```

9 Style strings

Using `fmt_txt()` is possible to style strings independently of the cell containing the string.

```
txt <- paste(
  fmt_txt("Embracing the full potential of "),
  fmt_txt("openxlsx2", bold = TRUE, size = 16),
  fmt_txt(" with "),
  fmt_txt("fmt_txt()", font = "Courier"),
  fmt_txt(" !")
)
wb <- wb_workbook()$add_worksheet()$add_data(x = txt)
```

As shown above it is possible to combine multiple styles together into a longer string. It is even possible to use `fmt_txt()` as `na.strings`:

```
df <- mtcars
df[df < 4] <- NA

na_red <- fmt_txt("N/A", color = wb_color("red"), italic = TRUE, bold = TRUE)

wb <- wb_workbook()$add_worksheet()$add_data(x = df, na.strings = na_red)
```

10 Create custom table styles

With `create_tablestyle()` it is possible to create your own table styles. This function uses `create_dxfs_style()` (just like your spreadsheet software does). Therefore, it is not quite as user-friendly. The following example shows how the function creates a red table style. The various dxfs styles must be created and assigned to the workbook (similar styles are used in conditional formatting). In `create_tablestyle()` these styles are assigned to the table style elements. Once the table style is created, it must also be assigned to the workbook. After that you can use it in the workbook like any other table style.

```
# a red table style
dx0 <- create_dxfs_style(
  border = TRUE,
  left_color = wb_color("red"),
  right_color = NULL, right_style = NULL,
  top_color = NULL, top_style = NULL,
  bottom_color = NULL, bottom_style = NULL
)

dx1 <- create_dxfs_style(
  border = TRUE,
  left_color = wb_color("red"),
  right_color = NULL, right_style = NULL,
  top_color = NULL, top_style = NULL,
  bottom_color = NULL, bottom_style = NULL
)

dx2 <- create_dxfs_style(
  border = TRUE,
  top_color = wb_color("red"),
  left_color = NULL, left_style = NULL,
  right_color = NULL, right_style = NULL,
  bottom_color = NULL, bottom_style = NULL
)

dx3 <- create_dxfs_style(
```

```

border = TRUE,
top_color = wb_color("red"),
left_color = NULL, left_style = NULL,
right_color = NULL, right_style = NULL,
bottom_color = NULL, bottom_style = NULL
)

dx4 <- create_dxfs_style(
  text_bold = TRUE
)

dx5 <- create_dxfs_style(
  text_bold = TRUE
)

dx6 <- create_dxfs_style(
  font_color = wb_color("red"),
  text_bold = TRUE,
  border = TRUE,
  top_style = "double",
  left_color = NULL, left_style = NULL,
  right_color = NULL, right_style = NULL,
  bottom_color = NULL, bottom_style = NULL
)

dx7 <- create_dxfs_style(
  font_color = wb_color("white"),
  text_bold = TRUE,
  bgFill = wb_color("red"),
  fgColor = wb_color("red")
)

dx8 <- create_dxfs_style(
  border = TRUE,
  left_color = wb_color("red"),
  top_color = wb_color("red"),
  right_color = wb_color("red"),
  bottom_color = wb_color("red")
)

```

```

wb <- wb_workbook() %>%
  wb_add_worksheet(gridLines = FALSE)

wb$add_style(dx0)
wb$add_style(dx1)
wb$add_style(dx2)
wb$add_style(dx3)
wb$add_style(dx4)
wb$add_style(dx5)
wb$add_style(dx6)
wb$add_style(dx7)
wb$add_style(dx8)

# finally create the table
xml <- create_tablestyle(
  name = "red_table",
  wholeTable = wb$styles_mgr$get_dxf_id("dx8"),
  headerRow = wb$styles_mgr$get_dxf_id("dx7"),
  totalRow = wb$styles_mgr$get_dxf_id("dx6"),
  firstColumn = wb$styles_mgr$get_dxf_id("dx5"),
  lastColumn = wb$styles_mgr$get_dxf_id("dx4"),
  firstRowStripe = wb$styles_mgr$get_dxf_id("dx3"),
  secondRowStripe = wb$styles_mgr$get_dxf_id("dx2"),
  firstColumnStripe = wb$styles_mgr$get_dxf_id("dx1"),
  secondColumnStripe = wb$styles_mgr$get_dxf_id("dx0")
)

wb$add_style(xml)

# create a table and apply the custom style
wb <- wb %>%
  wb_add_data_table(x = mtcars, tableStyle = "red_table")

```

11 Conditional Formatting

```
library(openxlsx2)
```

```
wb <- wb_workbook()
negStyle <- create_dxfs_style(font_color = wb_color(hex = "FF9C0006"), bgFill = wb_color(hex = "FF9C0006"))
posStyle <- create_dxfs_style(font_color = wb_color(hex = "FF006100"), bgFill = wb_color(hex = "FF006100"))
wb$styles_mgr$add(negStyle, "negStyle")
wb$styles_mgr$add(posStyle, "posStyle")
```

11.1 Rule applies to all each cell in range

	A	B

  type = "bottomN",  
  params = list(rank = 5)  
)
```

Highlight bottom 20 percentage in column y

```
wb$add_conditional_formatting(  
  "bottomN",  
  cols = 2,  
  rows = 2:11,  
  style = "negStyle",  
  type = "bottomN",  
  params = list(rank = 20, percent = TRUE)  
)  
wb$add_worksheet("logical operators")
```

11.16 Logical Operators

	A	
1	1	
2	2	
3	3	
4	4	
5	5	
6	6	
7	7	
8	8	
9	9	
10	10	
11		

You can use Excel's logical Operators

```
wb$add_data("logical operators", 1:10)
wb$add_conditional_formatting(
  "logical operators",
  cols = 1,
  rows = 1:10,
  rule = "OR($A1=1,$A1=3,$A1=5,$A1=7)"
)
```

12 charts

The following manual will present various ways to add plots and charts to `openxlsx2` worksheets and even chartsheets. This assumes that you have basic knowledge how to handle `openxlsx2` and are familiar with either the default R graphics functions like `plot()` or `barplot()` and `grDevices`, or with the packages `{ggplot2}`, `{rvg}` or `{mschart}`. There are plenty of other manuals that cover using these better than we could ever tell you to.

```
library(openxlsx2) # openxlsx2 >= 0.4 for mschart and rvg support

## create a workbook
wb <- wb_workbook()
```

12.1 Add plot to workbook

You can include any image in PNG or JPEG format. Simply open a device and save the output and pass it to the worksheet with `wb_add_image()`.

```
myplot <- tempfile(fileext = ".jpg")
jpeg(myplot)
print(plot(AirPassengers))
#> NULL
dev.off()
#> pdf
#> 2

# Add basic plots to the workbook
wb$add_worksheet("add_image")$add_image(file = myplot)
```

12.2 Add `{ggplot2}` plot to workbook

You can include `{ggplot2}` plots similar to how you would include them with `openxlsx`. Call the plot first and afterwards use `wb_add_plot()`.

```

if (requireNamespace("ggplot2")) {

library(ggplot2)

print(ggplot(mtcars, aes(x = mpg, fill = as.factor(gear))) +
  ggtitle("Distribution of Gas Mileage") +
  geom_density(alpha = I(.5)))

# Add ggplot to the workbook
wb$add_worksheet("add_plot")$
  add_plot(width = 5, height = 3.5, fileType = "png", units = "in")

}

#> Loading required namespace: ggplot2
#> Loading required namespace: testthat

```

12.3 Add plot via {rvg}

If you want vector graphics that can be modified in spreadsheet software the `dml_xlsx()` device comes in handy. You can pass the output via `wb_add_drawing()`.

```

if (requireNamespace("ggplot2") && requireNamespace("rvg")) {

  library(rvg)

  ## create rvg example
  tmp <- tempfile(fileext = ".xml")
  dml_xlsx(file = tmp, fonts = list(sans = "Bradley Hand"))
  print(ggplot(data = iris,
    mapping = aes(x = Sepal.Length, y = Petal.Width)) +
    geom_point() + labs(title = "With font Bradley Hand") +
    theme_minimal(base_family = "sans", base_size = 18))
  dev.off()

  # Add rvg to the workbook
  wb$add_worksheet("add_drawing")$
    add_drawing(xml = tmp)$
    add_drawing(xml = tmp, dims = NULL)

}
#> Loading required namespace: rvg

```

12.4 Add {mschart} plots

If you want native open xml charts, have a look at {mschart}. Create one of the chart files and pass it to the workbook with `wb_add_mschart()`. There are two options possible. 1. Either the default {mschart} output identical to the one in {officer}. Passing a data object and let {mschart} prepare the data. In this case `wb_add_mschart()` will add a new data region. 2. Passing a `wb_data()` object to {mschart}. This object contains references to the data on the worksheet and allows using data “as is”.

```

if (requireNamespace("mschart")) {

  library(mschart) # mschart >= 0.4 for openxlsx2 support

  ## create chart from mschart object (this creates new input data)
  mylc <- ms_linechart(
    data = browser_ts,
    x = "date",
    y = "freq",
    group = "browser"
  )
}

```

```

)

wb$add_worksheet("add_mschart")$add_mschart(dims = "A10:G25", graph = mylc)

## create chart referencing worksheet cells as input
# write data starting at B2
wb$add_worksheet("add_mschart - wb_data")$
  add_data(x = mtcars, dims = "B2")$
  add_data(x = data.frame(name = rownames(mtcars)), dims = "A2")

# create wb_data object this will tell this mschart
# from this PR to create a file corresponding to openxlsx2
dat <- wb_data(wb, dims = "A2:G10")

# create a few mscharts
scatter_plot <- ms_scatterchart(
  data = dat,
  x = "mpg",
  y = c("disp", "hp")
)

bar_plot <- ms_barchart(
  data = dat,
  x = "name",
  y = c("disp", "hp")
)

area_plot <- ms_areachart(
  data = dat,
  x = "name",
  y = c("disp", "hp")
)

line_plot <- ms_linechart(
  data = dat,
  x = "name",
  y = c("disp", "hp"),
  labels = c("disp", "hp")
)

```

```

# add the charts to the data
wb <- wb %>%
  wb_add_mschart(dims = "F4:L20", graph = scatter_plot) %>%
  wb_add_mschart(dims = "F21:L37", graph = bar_plot) %>%
  wb_add_mschart(dims = "M4:S20", graph = area_plot) %>%
  wb_add_mschart(dims = "M21:S37", graph = line_plot)

# add chartsheet
wb <- wb %>%
  wb_add_chartsheet() %>%
  wb_add_mschart(graph = scatter_plot)
}
#> Loading required namespace: mschart

```
