# **Preface**

This is a work in progress book describing the features of openxlsx2 (Barbone and Garbuszus 2023). Having written a book before, I never imagined to do this again and therefore I shall not do it. But still I consider it a nice addition to have something more flexible as our vignettes.

## 1 Introduction

Unfortunately the entire business world is still built almost entirely on Microsofts Office tools and whenever data is involved, this means that is largely built on the spreadsheet software Excel. R users that want to interact with this previously closed source file format had to rely on various packages. Packages that create workbook objects like xlsx (Dragulescu and Arendt 2023) and openxlsx (Schauberger and Walker 2023) and packages for special tasks namely\*readxl (Wickham and Bryan 2023) and writexl (Ooms 2023), some are Windows exclusive interacting with Excel via a DCOM server RDCOMClient and RExcel <sup>1</sup>.

In Excel 2007 a new open standard called OOXML(short for office open xml)<sup>2</sup> which we will refer to as openxml was introduced. In December 2006 this standard was accepted by the ECMA and it subsequently replaced the previously used xls files wherever people are working with spreadsheet software (after all we are all aware that accounting does not really care whatever file format they are using as long as it opens up in their favorite spreadsheet software). The openxml standard introduced the so called Excel 2007 workbook format xlsx. These files are a collection of zipped XML-files. This makes is easy to import the files to R, because all you need is a tool to unzip the files and an XML-parser to import the files as data frames. Still, since there are various tasks available to interact with spreadsheet file, there are also various tools required. If all you want to do is read from files readxl is probably enough, if all you want to do is write xlsx files writexl is probably the fastest choice available. Yet there are a plethora of other tasks available and this book is about them.

The predecessor to openxlsx2 (Barbone and Garbuszus 2023) called openxlsx (originally founded by Andrew Walker) was inspired by the rJava based xlsx package, but dropped the rJava dependency, and the support for the old xls files and wrote a custom XML parser in Rcpp (Eddelbuettel and François 2011). Later Phillip Schauberger picked up the abandoned openxlsx package and continues to maintain it. Finally openxlsx2 was forked from openxlsx to include (1) the pugixml (Kapoulkine 2006-2022) library to address shortcomings of the openxlsx XML parser and (2) to switch to the R6 (Chang 2021) package to introduce modern programming flows. Since then openxlsx2 has evolved a lot, includes many new features and is approaching a stable API release 1.0. This manual is supposed to bundle and extend the existing vignettes and to document the changes.

<sup>&</sup>lt;sup>1</sup>See https://github.com/omegahat/RDCOMClient.

<sup>&</sup>lt;sup>2</sup>See https://wikipedia.org/wiki/Office\_Open\_XML.

#### 1.1 Installation

You can install the stable version of openxlsx2 with:

```
install.packages('openxlsx2')
```

You can install the development version of openxlsx2 from GitHub with:

```
# install.packages("remotes")
remotes::install_github("JanMarvin/openxlsx2")

Or from r-universe with:

# Enable repository from janmarvin
options(repos = c(
    janmarvin = 'https://janmarvin.r-universe.dev',
    CRAN = 'https://cloud.r-project.org'))
# Download and install openxlsx2 in R
install.packages('openxlsx2')
```

## 1.2 Working with the package

We offer two different variants how to work with openxlsx2.

- The first one is to simply work with R objects. It is possible to read (read\_xlsx()) and write (write\_xlsx()) data from and to files. We offer a number of options in the commands to support various features of the openxml format, including reading and writing named ranges and tables. Furthermore, there are several ways to read certain information of an openxml spreadsheet without having opened it in a spreadsheet software before, e.g. to get the contained sheet names or tables.
- As a second variant openxlsx2 offers the work with so called wbWorkbook objects. Here an openxml file is read into a corresponding wbWorkbook object (wb\_load()) or a new one is created (wb\_workbook()). Afterwards the object can be further modified using various functions. For example, worksheets can be added or removed, the layout of cells or entire worksheets can be changed, and cells can be modified (overwritten or rewritten). Afterwards the wbWorkbook objects can be written as openxml files and processed by suitable spreadsheet software.

## 1.3 Example

This is a basic example which shows you how to solve a common problem:

```
library(openxlsx2)
  # read xlsx or xlsm files
  path <- system.file("extdata/openxlsx2_example.xlsx", package = "openxlsx2")</pre>
  read_xlsx(path)
    Var1 Var2 NA

#### 1.4 Authors and contributions

For a full list of all authors that have made this package possible and for whom we are greatful, please see:

```
system.file("AUTHORS", package = "openxlsx2")
```

If you feel like you should be included on this list, please let us know. If you have something to contribute, you are welcome. If something is not working as expected, open issues or if you have solved an issue, open a pull request. Please be respectful and be aware that we are volunteers doing this for fun in our unpaid free time. We will work on problems when we have time or need.

#### 1.5 License

The openxlsx2 package is licensed under the MIT license and is based on openxlsx (by Alexander Walker and Philipp Schauberger; COPYRIGHT 2014-2022) and pugixml (by Arseny Kapoulkine; COPYRIGHT 2006-2022). Both released under the MIT license.

### 1.6 A note on speed and memory usage

The current state of openxlsx2 is that it is reasonably fast. That is, it works well with reasonably large input data when reading or writing. It may not work well with data that tests the limits of the openxml specification. Things may slow down on the R side of things, and performance and usability will depend on the speed and size of the local operating system's CPU and memory.

Note that there are at least two cases where openxlsx2 constructs potentially large data frames (i) when loading, openxlsx2 usually needs to read the entire input file into pugixml and convert it into long data frame(s), and wb\_to\_df() converts one long data frame into two data frames that construct the output object and (ii) when adding data to the workbook, openxlsx2 reshapes the input data frame into a long data frame and stores it in the workbook, and writes the entire worksheet into a pugixml file that is written when it is complete. Applying cell styles, date conversions etc. will further slow down the process and finally the sheets will be zipped to provide the xlsx output.

Therefore, if you are faced with an unreasonably large dataset, either give yourself enough time, use another package to write the xlsx output (openxlsx2 was not written with the intention of working with maximum memory efficiency), and by all means use other ways to store data (binary file formats or a database). However, we are always happy to improve, so if you have found a way to improve what we are currently doing, please let us know and open an issue or a pull request.

## 2 basics

Welcome to the basic manual to openxlsx2. In this manual you will learn how to use openxlsx2 to import data from xlsx-files to R as well as how to export data from R to xlsx, and how to import and modify these openxml workbooks in R. This package is based on the work of many contributors to openxlsx. It was mostly rewritten using pugixml and R6 making use of modern technology, providing a fresh and easy to use R package.

Over the years many people have worked on the tricky task to handle xls and xlsx files. Notably openxlsx, but there are countless other R-packages as well as third party libraries or calculation software capable of handling such files. Please feel free to use and test your files with other software and or let us know about your experience. Open an issue on github or write us a mail.

### 2.1 Importing data

Coming from openxlsx you might know about read.xlsx() (two functions, one for files and one for workbooks) and readWorkbook(). Functions that do different things, but mostly the same. In openxlsx2 we tried our best to reduce the complexity under the hood and for the user as well. In openxlsx2 they are replaced with read\_xlsx(), wb\_read() and they share the same underlying function wb\_to\_df().

For this example we will use example data provided by the package. You can locate it in our "inst/extdata" folder. The files are included with the package source and you can open them in any calculation software as well.

#### 2.1.1 Basic import

We begin with the openxlsx2\_example.xlsx file by telling R where to find this file on our system

```
xlsxFile <- system.file("extdata", "openxlsx2_example.xlsx", package = "openxlsx2")</pre>
```

The object contains a path to the xlsx file and we pass this file to our function to read the workbook into R

```
# import workbook
wb_to_df(xlsxFile)
       Var1 Var2 NA
                                          Var5
                                                         Var6
                                                                  Var7
                       Var3
                              Var4
                                                                             Var8

                                                                    122
                                                                             <NA>
          NA
```

The output is created as a data frame and contains data types date, logical, numeric and character. The function to import the file to R, wb\_to\_df() provides similar options as the openxlsx functions read.xlsx() and readWorkbook() and a few new functions we will go through the options. As you might have noticed, we return the column of the xlsx file as the row name of the data frame returned. Per default the first sheet in the workbook is imported. If you want to switch this, either provide the sheet parameter with the correct index or provide the sheet name.

#### 2.1.2 colNames - first row as column name

In the previous example the first imported row was used as column name for the data frame. This is the default behavior, but not always wanted or expected. Therefore this behavior can be disabled by the user.

```
# do not convert first row to colNames
                     colNames =
wb to df(xlsxFile,
                                 FALSE)
                    D
                                 F
                                              G
                                                                     Ι
           В
                С
                           Ε
                                                            Η
                                                                                J

#### 2.1.3 detectDates - convert cells to R dates

The creators of the openxml standard are well known for mistakenly treating something as a date and openxlsx2 has built in ways to identify a cell as a date and will try to convert the value for you, but unfortunately this is not always a trivial task and might fail. In such a case we provide an option to disable the date conversion entirely. In this case the underlying numerical value will be returned.

#### 2.1.4 showFormula - show formulas instead of results

Sometimes things might feel off. This can be because the openxml files are not updating formula results in the sheets unless they are opened in software that provides such functionality as certain tabular calculation software. Therefore the user might be interested in the underlying functions to see what is going on in the sheet. Using showFormula this is possible

					_		ormula inste	ead of their	values	
#>		Var1	Var2	NA	Var3	Var4	Var5	Var6	Var7	Var8

                              <NA> 2023-07-31
#> 12
          NA
                1 NA
                        123
                                                        <NA>
                                                                       E12-C12
                                                                                    <NA>
```

#### 2.1.5 dims - read specific dimension

Sometimes the entire worksheet contains to much data, in such case we provide functions to read only a selected dimension range. Such a range consists of either a specific cell like "A1" or a cell range in the notion used in the openxml standard

```
# read dimension withot colNames
wb_to_df(xlsxFile, dims = "A2:C5", colNames = FALSE)
#> A B C
#> 2 NA NA Var2
#> 3 NA TRUE 1
#> 4 NA TRUE <NA>
#> 5 NA TRUE 2
```

#### 2.1.6 cols - read selected columns

If you do not want to read a specific cell, but a cell range you can use the column attribute. This attribute takes a numeric vector as argument

```
# read selected cols
wb_to_df(xlsxFile, cols = c("A:B", "G"))
      NA
          Var1
                      Var5
#> 3
     NA
          TRUE 2023-05-29

                      <NA>
#> 7
      NA FALSE
                      <NA>
#> 8
     NA FALSE 2023-03-02
      NA
            NA
                      <NA>
#> 10 NA FALSE 2023-12-24
#> 11 NA FALSE 2023-12-25
#> 12 NA
            NA 2023-07-31
```

#### 2.1.7 rows - read selected rows

The same goes with rows. You can select them using numeric vectors

```
# read selected rows
wb to df(xlsxFile, rows = c(2, 4, 6))
      Var1 Var2 NA
                     Var3
                           Var4
                                       Var5 Var6
                                                  Var7
                                                            Var8
      TRUE
             NA NA #NUM!
                               b 2023-05-23
                                               NA
                                                     0 14:02:57
#> 6 FALSE
              2 NA
                     <NA> #NUM!
                                       <NA>
                                               NA
                                                     2 17:24:53
```

#### 2.1.8 convert - convert input to guessed type

In xml exists no difference between value types. All values are per default characters. To provide these as numerics, logicals or dates, openxlsx2 and every other software dealing with xlsx files has to make assumptions about the cell type. This is especially tricky due to the notion of worksheets. Unlike in a data frame, a worksheet can have a wild mix of all types of data. Even though the conversion process from character to date or numeric is rather solid, sometimes the user might want to see the data without any conversion applied. This might be useful in cases where something unexpected happened or the import created warnings. In such a case you can look at the raw input data. If you want to disable date detection as well, please see the entry above.

```
# convert characters to numerics and date (logical too?)
wb to df(xlsxFile, convert = FALSE)
       Var1 Var2
                    NA
#>
                         Var3
                                            Var5
                                                          Var6
                                                                   Var7
                                                                             Var8
#> 3

```

#### 2.1.9 skipEmptyRows - remove empty rows

Even though openx1sx2 imports everything as requested, sometimes it might be helpful to remove empty lines from the data. These might be either left empty intentional or empty because they are were formatted, but the cell value was removed afterwards. This was added

mostly for backward comparability, but the default has been changed to FALSE. The behavior has changed a bit as well. Previously empty cells were removed prior to the conversion to R data frames, now they are removed after the conversion and are removed only if they are completely empty

```
# erase empty Rows from dataset
wb_to_df(xlsxFile, sheet = 1, skipEmptyRows = TRUE) |> tail()
#>
       Var1 Var2 NA Var3 Var4
                                      Var5 Var6 Var7

                                                                     <NA>
                   123 <NA> 2023-07-31
#> 12
         NA
               1
                                                   <NA>
                                                            122
                                                                     <NA>
```

#### 2.1.11 rowNames - keep rownames from input

Sometimes the data source might provide rownames as well. In such a case you can openxlsx2 to treat the first column as rowname

```
# convert first row to rownames
wb_to_df(xlsxFile, sheet = 2, dims = "C6:G9", rowNames = TRUE)
```

```
#> mpg cyl disp hp
#> Mazda RX4 21.0 6 160 110
#> Mazda RX4 Wag 21.0 6 160 110
#> Datsun 710 22.8 4 108 93
```

#### 2.1.12 types - convert column to specific type

If the user know better than the software what type to expect in a worksheet, this can be provided via types. This parameter takes a named numeric. 0 is character, 1 is numeric and 2 is date

```
# define type of the data.frame
wb_to_df(xlsxFile, cols = c(2, 5), types = c("Var1" = 0, "Var3" = 1))
#>
       Var1
              Var3
#> 3
       TRUE
              1.00
#> 4
       TRUE
               NaN
       TRUE
              1.34
#> 5
      FALSE
                NA
#> 7
      FALSE
              1.56
      FALSE
              1.70
#> 8
#> 9
       <NA>
                NA
#> 10 FALSE
             23.00
#> 11 FALSE
            67.30
#> 12 <NA> 123.00
```

#### 2.1.13 startRow - where to begin

Often the creator of the worksheet has used a lot of creativity and the data does not begin in the first row, instead it begins somewhere else. To define the row where to begin reading, define it via the startRow parameter

```
# start in row 5
wb_to_df(xlsxFile, startRow = 5, colNames = FALSE)
                        Ε
                               F
                                           G
                                             Η
#>
                D
                                                       Ι
                                                                J
#> 5
       TRUE
             2 NA
                     1.34
                               c 2023-02-01 NA #VALUE! 23:01:02
      FALSE
             2 NA
                       NA #NUM!
                                        <NA> NA
                                                       2 17:24:53
      FALSE
                     1.56
                                                   <NA>
#> 7
             3 NA
                                        <NA> NA
                                                             <NA>
                               е
#> 8
      FALSE
             1 NA
                     1.70

                                                             <NA>
```

```
#> 11 FALSE 3 NA 67.30 i 2023-12-25 NA 3 <NA>
#> 12 NA 1 NA 123.00 <NA> 2023-07-31 NA 122 <NA>
```

#### 2.1.14 na.strings - define missing values

There is the "#N/A" string, but often the user will be faced with custom missing values and other values we are not interested. Such strings can be passed as character vector via na.strings

```
# na string
wb to df(xlsxFile, na.strings =
       Var1 Var2 NA
                       Var3
                                          Var5
                                                        Var6
                                                                 Var7
                                                                           Var8
       TRUE
                1 NA
                                 a 2023-05-29 3209324 This #DIV/0! 01:27:15
#> 3
                          1
#> 4
       TRUE
               NA NA #NUM!
                                 b 2023-05-23

```

#### 2.1.15 Importing as workbook

In addition to importing directly from xlsx or xlsm files, openxlsx2 provides the wbWorkbook class used for importing and modifying entire the openxml files in R. This workbook class is the heart of openxlsx2 and probably the reason why you are reading this manual in the first place.

Importing a file into a workbook looks like this:

```
# the file we are going to load
xlsxFile <- system.file("extdata", "openxlsx2_example.xlsx", package = "openxlsx2")
# loading the file into the workbook
wb <- wb_load(file = xlsxFile)</pre>
```

The additional options wb\_load() provides are for internal use: sheet loads only a selected sheet from the workbook and data\_only reads only the data parts from a workbook and ignores any additional graphics or pivot tables. Both functions create workbook objects that

can only be used to read data, and we do not recommend end users to use them. Especially not if they intend to re-export the workbook afterwards.

Once a workbook is imported, we provide several functions to interact with and modify it (the wb\_to\_df() function mentioned above works the same way for an imported workbook). It is possible to add new sheets and remove sheets, as well as to add or remove data. R-plots can be inserted and also the style of the workbook can be changed, new fonts, background colors and number formats. There is a wealth of options explained in the man pages and the additional style vignette (more vignettes to follow).

## 2.2 Exporting data

#### 2.2.1 Exporting data frames or vectors

If you want to export a data frame from R, you can use write\_xlsx() which will create an xlsx file. This file can be tweaked further. The man page provides various options (further explanation and examples will follow).

```
write_xlsx(mtcars, "mtcars.xlsx")
```

#### 2.2.2 Exporting wbWorkbooks

Imported workbooks can be saved as xlsx or xlsm files with the wrapper wb\_save() or with wb\$save(). Both functions take the filename and an optional Overwrite option. If the latter is set, an optional guard is provided to check if the file you want to write already exists. But be careful, this is optional. The default is to save the file and replace an existing file. Of course, in Windows, files that are locked (for example, if they were opened by another process) will not be replaced.

```
# replace the existing file
wb$save("mtcars.xlsx")

# do not overwrite the exisisting file
try(wb$save("mtcars.xlsx", overwrite = FALSE))
```

# 3 styling

Welcome to the styling manual for openxlsx2. In this manual you will learn how to use openxlsx2 to style your worksheets. data from xlsx-files to R as well as how to export data from R to xlsx, and how to import and modify these openxml workbooks in R.

### 3.1 Colors, text rotation and number formats

Below we show you two ways how to create styled tables with openxlsx2 one using the high level functions to style worksheet areas and one using the bare metal approach of creating the identical table. We show both ways to create styles in openxlsx2 to show how you could build on our functions or create your very own functions.

Figure 3.1: The example below, with increased column width.

#### 3.1.1 the quick way: using high level functions

```
# add some dummy data
set.seed(123)
mat <- matrix(rnorm(28 * 28, mean = 44444, sd = 555), ncol = 28)
colnames(mat) <- make.names(seq_len(ncol(mat)))
border_col <- wb_color(theme = 1)
border_sty <- "thin"</pre>
```

```
# prepare workbook with data and formated first row
wb <- wb_workbook() %>%
 wb_add_worksheet("test") %>%
 wb_add_data(x = mat) %>%
 wb_add_border(dims = "A1:AB1",
   top_color = border_col, top_border = border_sty,
   bottom_color = border_col, bottom_border = border_sty,
   left_color = border_col, left_border = border_sty,
   right_color = border_col, right_border = border_sty,
   inner_hcolor = border_col, inner_hgrid = border_sty
 ) %>%
 wb add fill(dims = "A1:AB1", color = wb color(hex = "FF334E6F")) %>%
 wb_add_cell_style(dims = "A1:AB1", horizontal = "center", textRotation = 45)
# create various number formats
x <- c(
 0, 1, 2, 3, 4, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22,
 37, 38, 39, 40, 45, 46, 47, 48, 49
# apply the styles
for (i in seq_along(x)) {
 cell <- sprintf("%s2:%s29", int2col(i), int2col(i))</pre>
 wb <- wb %>% wb_add_numfmt(dims = cell, numfmt = x[i])
}
# wb$open()
```

#### 3.1.2 the long way: using bare metal functions

```
# create workbook
wb <- wb_workbook() %>% wb_add_worksheet("test")

# add some dummy data to the worksheet
set.seed(123)
mat <- matrix(rnorm(28 * 28, mean = 44444, sd = 555), ncol = 28)
colnames(mat) <- make.names(seq_len(ncol(mat)))
wb$add_data(x = mat, colNames = TRUE)</pre>
```

```
# create a border style and assign it to the workbook
black <- wb_color(hex = "FF000000")</pre>
new_border <- create_border(</pre>
 bottom = "thin", bottom_color = black,
 top = "thin", top_color = black,
 left = "thin", left_color = black,
 right = "thin", right_color = black
wb$styles_mgr$add(new_border, "new_border")
# create a fill style and assign it to the workbook
new_fill <- create_fill(patternType = "solid", fgColor = wb_color(hex = "FF334E6F"))</pre>
wb$styles_mgr$add(new_fill, "new_fill")
# create a font style and assign it to the workbook
wb$styles_mgr$add(new_font, "new_font")
# create a new cell style, that uses the fill, the font and the border style
new_cellxfs <- create_cell_style(</pre>
 numFmtId = 0,
 horizontal = "center",
 textRotation = 45,
 fillId = wb$styles_mgr$get_fill_id("new_fill"),
 fontId = wb$styles_mgr$get_font_id("new_font"),
 borderId = wb$styles_mgr$get_border_id("new_border")
# assign this style to the workbook
wb$styles_mgr$add(new_cellxfs, "new_styles")
# assign the new cell style to the header row of our data set
cell <- sprintf("A1:%s1", int2col(nrow(mat)))</pre>
wb <- wb %>% wb_set_cell_style(
 dims = cell,
 style = wb$styles_mgr$get_xf_id("new_styles")
)
## style the cells with some builtin format codes (no new numFmt entry is needed)
# add builtin style ids
x <- c(
```

```
1, 2, 3, 4, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22,
  37, 38, 39, 40, 45, 46, 47, 48, 49
# create styles
new_cellxfs <- create_cell_style(numFmtId = x, horizontal = "center")</pre>
# assign the styles to the workbook
for (i in seq_along(x)) {
  wb$styles_mgr$add(new_cellxfs[i], paste0("new_style", i))
}
# new styles are 1:28
new_styles <- wb$styles_mgr$get_xf()</pre>
for (i in as.integer(new_styles$id[new_styles$name %in% paste0("new_style", seq_along(x))]
 cell <- sprintf("%s2:%s29", int2col(i), int2col(i))</pre>
  wb <- wb %>% wb_set_cell_style(dims = cell, style = i)
}
# assign a custom tabColor
wb$worksheets[[1]]$sheetPr <- xml_node_create(</pre>
  "sheetPr",
  xml_children = xml_node_create(
    "tabColor",
   xml_attributes = wb_color(hex = "FF00FF00")
  )
)
# # look at the beauty you've created
# wb_open(wb)
```

# 4 Working with number formats

Per default openxlsx2 will pick up number formats for selected R classes.

#### 4.1 numfmts

```
## Create Workbook object and add worksheets
wb <- wb_workbook()</pre>
wb$add_worksheet("S1")
wb$add_worksheet("S2")
df <- data.frame(</pre>
  "Date" = Sys.Date() - 0:19,
  "T" = TRUE, "F" = FALSE,
  "Time" = Sys.time() - 0:19 * 60 * 60,
  "Cash" = paste("$", 1:20), "Cash2" = 31:50,
  "hLink" = "https://CRAN.R-project.org/",
  "Percentage" = seq(0, 1, length.out = 20),
  "TinyNumbers" = runif(20) / 1E9, stringsAsFactors = FALSE
## openxlsx will apply default Excel styling for these classes
class(df$Cash) <- c(class(df$Cash), "currency")</pre>
class(df$Cash2) <- c(class(df$Cash2), "accounting")</pre>
class(df$hLink) <- "hyperlink"</pre>
class(df$Percentage) <- c(class(df$Percentage), "percentage")</pre>
class(df$TinyNumbers) <- c(class(df$TinyNumbers), "scientific")</pre>
wb$add_data("S1", x = df, startRow = 4, rowNames = FALSE)
wb$add_data_table("S2", x = df, startRow = 4, rowNames = FALSE)
```

#### 4.2 numfmts2

In addition, you can set the style to be picked up using openxlsx2 options.

```
wb <- wb_workbook()</pre>
wb <- wb_add_worksheet(wb, "test")</pre>
options("openxlsx2.dateFormat" = "yyyy")
options("openxlsx2.datetimeFormat" = "yyyy-mm-dd")
options("openxlsx2.numFmt" = "€ #.0")
df <- data.frame(</pre>
  "Date" = Sys.Date() - 0:19,
  "T" = TRUE, "F" = FALSE,
  "Time" = Sys.time() -0:19*60*60,
  "Cash" = paste("$", 1:20), "Cash2" = 31:50,
  "hLink" = "https://CRAN.R-project.org/",
  "Percentage" = seq(0, 1, length.out = 20),
  "TinyNumbers" = runif(20) / 1E9, stringsAsFactors = FALSE,
  "numeric" = 1
## openxlsx will apply default Excel styling for these classes
class(df$Cash) <- c(class(df$Cash), "currency")</pre>
class(df$Cash2) <- c(class(df$Cash2), "accounting")</pre>
class(df$hLink) <- "hyperlink"</pre>
class(df$Percentage) <- c(class(df$Percentage), "percentage")</pre>
class(df$TinyNumbers) <- c(class(df$TinyNumbers), "scientific")</pre>
wb$add_data("test", df)
```

# 5 Modifying the column widths

## 5.1 wb\_set\_col\_widths

```
wb <- wb_workbook() %>%
  wb_add_worksheet() %>%
  wb_add_data(x = mtcars, rowNames = TRUE)

cols <- 1:12
wb <- wb %>% wb_set_col_widths(cols = cols, widths = "auto")
```

# 6 Adding borders

#### 6.1 add borders

```
wb <- wb_workbook()</pre>
# full inner grid
wb$add_worksheet("S1", gridLines = FALSE)$add_data(x = mtcars)
wb$add_border(
  dims = "A2:K33",
  inner_hgrid = "thin", inner_hcolor = wb_color(hex = "FF808080"),
  inner_vgrid = "thin", inner_vcolor = wb_color(hex = "FF808080")
)
# only horizontal grid
wb$add_worksheet("S2", gridLines = FALSE)$add_data(x = mtcars)
wb$add_border(dims = "A2:K33", inner_hgrid = "thin", inner_hcolor = wb_color(hex = "FF8080")
# only vertical grid
wb$add_worksheet("S3", gridLines = FALSE)$add_data(x = mtcars)
wb$add_border(dims = "A2:K33", inner_vgrid = "thin", inner_vcolor = wb_color(hex = "FF8080
# no inner grid
wb$add_worksheet("S4", gridLines = FALSE)$add_data(x = mtcars)
wb$add_border("S4", dims = "A2:K33")
```

## 6.2 styled table

Below we show you two ways how to create styled tables with openxlsx2 one using the high level functions to style worksheet areas and one using the bare metal approach of creating the identical table.

			-
X1		X2	_
	1		3
	2		4

#### 6.2.1 the quick way: using high level functions

```
# add some dummy data to the worksheet
mat <- matrix(1:4, ncol = 2, nrow = 2)</pre>
colnames(mat) <- make.names(seq_len(ncol(mat)))</pre>
wb <- wb_workbook() %>%
  wb_add_worksheet("test") %>%
  wb add_data(x = mat, colNames = TRUE, startCol = 2, startRow = 2) %>%
  # center first row
  wb_add_cell_style(dims = "B2:C2", horizontal = "center") %>%
  # add border for first row
  wb add border(
    dims = "B2:C2",
    bottom_color = wb_color(theme = 1), bottom_border = "thin",
    top_color = wb_color(theme = 1), top_border = "double",
    left_border = NULL, right_border = NULL
  ) %>%
  # add border for last row
  wb_add_border(
    dims = "B4:C4",
    bottom_color = wb_color(theme = 1), bottom_border = "double",
    top_border = NULL, left_border = NULL, right_border = NULL
  )
```

#### 6.2.2 the long way: creating everything from the bone

```
# add some dummy data to the worksheet
mat <- matrix(1:4, ncol = 2, nrow = 2)
colnames(mat) <- make.names(seq_len(ncol(mat)))

wb <- wb_workbook() %>%
   wb_add_worksheet("test") %>%
   wb_add_data(x = mat, startCol = 2, startRow = 2)

# create a border style and assign it to the workbook
black <- wb_color(hex = "FF0000000")
top_border <- create_border(
   top = "double", top_color = black,
   bottom = "thin", bottom_color = black</pre>
```

```
)
bottom_border <- create_border(bottom = "double", bottom_color = black)</pre>
wb$styles_mgr$add(top_border, "top_border")
wb$styles_mgr$add(bottom_border, "bottom_border")
# create a new cell style, that uses the fill, the font and the border style
top_cellxfs <- create_cell_style(</pre>
  numFmtId = 0,
 horizontal = "center",
  borderId = wb$styles_mgr$get_border_id("top_border")
bottom_cellxfs <- create_cell_style(</pre>
  numFmtId = 0,
  borderId = wb$styles_mgr$get_border_id("bottom_border")
# assign this style to the workbook
wb$styles_mgr$add(top_cellxfs, "top_styles")
wb$styles_mgr$add(bottom_cellxfs, "bottom_styles")
# assign the new cell style to the header row of our data set
cell <- "B2:C2"
wb <- wb %>% wb_set_cell_style(dims = cell, style = wb$styles_mgr$get_xf_id("top_styles"))
cell <- "B4:C4"
wb <- wb %>% wb_set_cell_style(dims = cell, style = wb$styles_mgr$get_xf_id("bottom_styles
```

# 7 Use workbook colors and modify them

The loop below will apply the tint attribute to the fill color

Figure 7.1: Tint variations of the theme colors.

```
wb <- wb_workbook() %>% wb_add_worksheet("S1")

tints <- seq(-0.9, 0.9, by = 0.1)

for (i in 0:9) {
   for (tnt in tints) {
    col <- pasteO(int2col(i + 1), which(tints %in% tnt))

   if (tnt == 0) {
      wb <- wb %>% wb_add_fill(dims = col, color = wb_color(theme = i))
    } else {
```

```
wb <- wb %>% wb_add_fill(dims = col, color = wb_color(theme = i, tint = tnt))
}
}
```

# 8 Copy cell styles

It is possible to copy the styles of several cells at once. In the following example, the styles of some cells from a formatted workbook are applied to a previously empty cell range. Be careful though, wb\_get\_cell\_style() returns only some styles, so you have to make sure that the copy-from and copy-to dimensions match in a meaningful way.

```
wb <- wb_load(system.file("extdata", "oxlsx2_sheet.xlsx", package = "openxlsx2")) %>%
  wb_set_cell_style(1, "A30:G35", wb_get_cell_style(., 1, "A10:G15"))
# wb_open(wb)
```

# 9 Style strings

Using fmt\_txt() is possible to style strings independently of the cell containing the string.

```
txt <- paste(
  fmt_txt("Embracing the full potential of "),
  fmt_txt("openxlsx2", bold = TRUE, size = 16),
  fmt_txt(" with "),
  fmt_txt("fmt_txt()", font = "Courier"),
  fmt_txt(" !")
)
wb <- wb_workbook()$add_worksheet()$add_data(x = txt)</pre>
```

As shown above it is possible to combine multiple styles together into a longer string. It is even possible to use fmt\_txt() as na.strings:

```
df <- mtcars
df[df < 4] <- NA

na_red <- fmt_txt("N/A", color = wb_color("red"), italic = TRUE, bold = TRUE)

wb <- wb_workbook()$add_worksheet()$add_data(x = df, na.strings = na_red)</pre>
```

# 10 Create custom table styles

With create\_tablestyle() it is possible to create your own table styles. This function uses create\_dxfs\_style() (just like your spreadsheet software does). Therefore, it is not quite as user-friendly. The following example shows how the function creates a red table style. The various dxfs styles must be created and assigned to the workbook (similar styles are used in conditional formatting). In create\_tablestyle() these styles are assigned to the table style elements. Once the table style is created, it must also be assigned to the workbook. After that you can use it in the workbook like any other table style.

```
# a red table style
dx0 <- create_dxfs_style(</pre>
  border = TRUE,
  left_color = wb_color("red"),
  right color = NULL, right style = NULL,
  top color = NULL, top style = NULL,
  bottom_color = NULL, bottom_style = NULL
dx1 <- create_dxfs_style(</pre>
  border = TRUE,
  left_color = wb_color("red"),
  right_color = NULL, right_style = NULL,
  top_color = NULL, top_style = NULL,
  bottom_color = NULL, bottom_style = NULL
dx2 <- create dxfs style(</pre>
  border = TRUE,
  top color = wb color("red"),
  left_color = NULL, left_style = NULL,
  right_color = NULL, right_style = NULL,
  bottom_color = NULL, bottom_style = NULL
dx3 <- create_dxfs_style(</pre>
```

```
border = TRUE,
  top_color = wb_color("red"),
  left_color = NULL, left_style = NULL,
 right_color = NULL, right_style = NULL,
  bottom_color = NULL, bottom_style = NULL
dx4 <- create_dxfs_style(</pre>
  text_bold = TRUE
dx5 <- create_dxfs_style(</pre>
 text_bold = TRUE
dx6 <- create_dxfs_style(</pre>
  font_color = wb_color("red"),
 text_bold = TRUE,
  border = TRUE,
  top_style = "double",
 left_color = NULL, left_style = NULL,
 right_color = NULL, right_style = NULL,
 bottom_color = NULL, bottom_style = NULL
dx7 <- create_dxfs_style(</pre>
 font_color = wb_color("white"),
 text_bold = TRUE,
 bgFill = wb_color("red"),
  fgColor = wb_color("red")
)
dx8 <- create_dxfs_style(</pre>
  border = TRUE,
  left_color = wb_color("red"),
  top_color = wb_color("red"),
 right_color = wb_color("red"),
 bottom_color = wb_color("red")
```

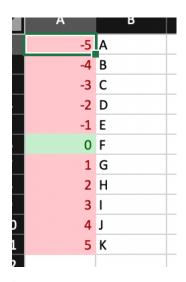

```
wb <- wb_workbook() %>%
  wb_add_worksheet(gridLines = FALSE)
wb$add_style(dx0)
wb$add_style(dx1)
wb$add_style(dx2)
wb$add style(dx3)
wb$add_style(dx4)
wb$add_style(dx5)
wb$add_style(dx6)
wb$add_style(dx7)
wb$add_style(dx8)
# finally create the table
xml <- create_tablestyle(</pre>
  name
                        = "red_table",
                 = wb$styles_mgr$get_dxf_id("dx8"),
= wb$styles_mgr$get_dxf_id("dx7"),
= wb$styles_mgr$get_dxf_id("dx6"),
= wb$styles_mgr$get_dxf_id("dx5"),
= wb$styles_mgr$get_dxf_id("dx4"),
  wholeTable
  headerRow
  totalRow
  firstColumn
  lastColumn
  firstRowStripe = wb$styles_mgr$get_dxf_id("dx3"),
  secondRowStripe = wb$styles_mgr$get_dxf_id("dx2"),
  firstColumnStripe = wb$styles_mgr$get_dxf_id("dx1"),
  secondColumnStripe = wb$styles_mgr$get_dxf_id("dx0")
)
wb$add_style(xml)
# create a table and apply the custom style
wb <- wb %>%
  wb_add_data_table(x = mtcars, tableStyle = "red_table")
```

# 11 Conditional Formatting

```
library(openxlsx2)

wb <- wb_workbook()
negStyle <- create_dxfs_style(font_color = wb_color(hex = "FF9C0006"), bgFill = wb_color(h
posStyle <- create_dxfs_style(font_color = wb_color(hex = "FF006100"), bgFill = wb_color(h
wb$styles_mgr$add(negStyle, "negStyle")
wb$styles_mgr$add(posStyle, "posStyle")</pre>
```

### 11.1 Rule applies to all each cell in range

```
wb$add_worksheet("cellIs")
wb$add_data("cellIs", -5:5)
wb$add_data("cellIs", LETTERS[1:11], startCol = 2)
wb$add_conditional_formatting(
    "cellIs",
    cols = 1,
```

```
rows = 1:11,
rule = "!=0",
style = "negStyle"
)
wb$add_conditional_formatting(
   "cellIs",
   cols = 1,
   rows = 1:11,
   rule = "==0",
   style = "posStyle"
)
```

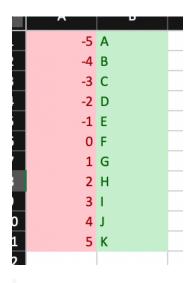

## 11.2 Highlight row dependent on first cell in row

	Α	В
1	-5 /	A
1 2 3	-4	В
3	-3 (	С
4 5 6 7 8	-2	D

   rows = 1:100,
   type = "endsWith",
   rule = "A"</pre>
```

)

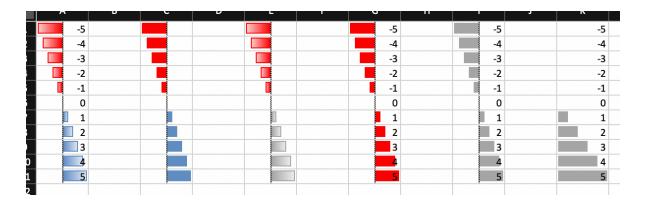

#### 11.11 Colorscale colors cells based on cell value

```
df <- read_xlsx("https://github.com/JanMarvin/openxlsx-data/raw/main/readTest.xlsx", sheet
wb$add_worksheet("colorScale", zoom = 30)
wb$add_data("colorScale", df, colNames = FALSE) ## write data.frame</pre>
```

Rule is a vector or colors of length 2 or 3 (any hex color or any of colors()). If rule is NULL, min and max of cells is used. Rule must be the same length as style or L.

```
wb$add_conditional_formatting(
    "colorScale",
    cols = c(1, ncol(df)),
    rows = seq_len(nrow(df)),
    style = c("black", "white"),
    rule = c(0, 255),
    type = "colorScale"
)
wb$set_col_widths("colorScale", cols = seq_along(df), widths = 1.07)
wb$set_row_heights("colorScale", rows = seq_len(nrow(df)), heights = 7.5)
```

#### 11.12 Databars

```
wb$add_worksheet("databar")
## Databars
```

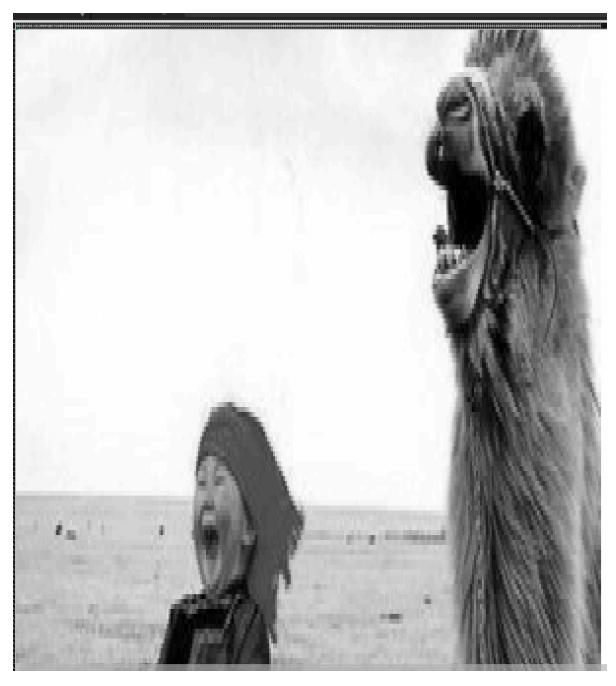

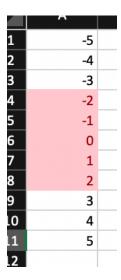

Figure 11.1: Yep, that is a color scale image.

```
wb$add_data("databar", -5:5, startCol = 1)
wb <- wb_add_conditional_formatting(</pre>
  wb,
  "databar",
  cols = 1,
  rows = 1:11,
 type = "dataBar"
) ## Default colors
wb$add_data("databar", -5:5, startCol = 3)
wb <- wb_add_conditional_formatting(</pre>
  wb,
  "databar",
 cols = 3,
  rows = 1:11,
  type = "dataBar",
  params = list(
    showValue = FALSE,
    gradient = FALSE
  )
) ## Default colors
wb$add_data("databar", -5:5, startCol = 5)
wb <- wb_add_conditional_formatting(</pre>
  wb,
  "databar",
 cols = 5,
 rows = 1:11,
  type = "dataBar",
  style = c("#a6a6a6"),
  params = list(showValue = FALSE)
wb$add_data("databar", -5:5, startCol = 7)
wb <- wb_add_conditional_formatting(</pre>
  wb,
  "databar",
  cols = 7,
  rows = 1:11,
  type = "dataBar",
  style = c("red"),
```

```
params = list(
    showValue = TRUE,
    gradient = FALSE
  )
)
# custom color
wb$add_data("databar", -5:5, startCol = 9)
wb <- wb_add_conditional_formatting(</pre>
  wb,
  "databar",
 cols = 9,
  rows = 1:11,
 type = "dataBar",
  style = c("#a6a6a6", "#a6a6a6"),
  params = list(showValue = TRUE, gradient = FALSE)
# with rule
wb\$add_data(x = -5:5, startCol = 11)
wb <- wb_add_conditional_formatting(</pre>
  wb,
  "databar",
  cols = 11,
 rows = 1:11,
 type = "dataBar",
 rule = c(0, 5),
 style = c("#a6a6a6", "#a6a6a6"),
 params = list(showValue = TRUE, gradient = FALSE)
```

#### 11.13 Between

Highlight cells in interval [-2, 2]

```
wb$add_worksheet("between")
wb$add_data("between", -5:5)
wb$add_conditional_formatting(
   "between",
   cols = 1,
   rows = 1:11,
   type = "between",
   rule = c(-2, 2)
)
wb$add_worksheet("topN")
```

### 11.14 Top N

4	А	В	
1	х	у	
2	1	1,604212	
3	2	-0,51541	
4	3	1,012537	
5	4	-0,03594	
5	5	-0,66734	
7	6	0,92338	
3	7	1,3811

0	9	-0,5094	
1	10	-0,46979	
2			

```
wb$add_data("topN", data.frame(x = 1:10, y = rnorm(10)))
```

Highlight top 5 values in column x

```
wb$add_conditional_formatting(
   "topN",
   cols = 1,
   rows = 2:11,
   style = "posStyle",
   type = "topN",
   params = list(rank = 5)
)
```

Highlight top 20 percentage in column y

```
wb$add_conditional_formatting(
   "topN",
   cols = 2,
   rows = 2:11,
   style = "posStyle",
   type = "topN",
   params = list(rank = 20, percent = TRUE)
)
wb$add_worksheet("bottomN")
```

#### 11.15 Bottom N

4	^		
1	х	у	
2	1	1,377676	
3	2	0,352826	
4	3	0,829574	
5	4	-0,3387	
6	5	1,261035	
7	6	-0,80876	
8	7	0,625352	
9	8	-0,81717	
10	9	-2,46258	
11	10	-1,34296	
12			

```
wb$add_data("bottomN", data.frame(x = 1:10, y = rnorm(10)))
```

Highlight bottom 5 values in column  $\mathbf x$ 

```
wb$add_conditional_formatting(
   "bottomN",
   cols = 1,
   rows = 2:11,
   style = "negStyle",
   type = "bottomN",
   params = list(rank = 5)
)
```

Highlight bottom 20 percentage in column y

```
wb$add_conditional_formatting(
   "bottomN",
   cols = 2,
   rows = 2:11,
   style = "negStyle",
   type = "bottomN",
   params = list(rank = 20, percent = TRUE)
)
wb$add_worksheet("logical operators")
```

### 11.16 Logical Operators

	Α	
1	1	
2	2	
	3	
4	4	
5	5	
6	6	
7	7	
8	8	
9	9	
10	10	
11		

You can use Excels logical Operators

```
wb$add_data("logical operators", 1:10)
wb$add_conditional_formatting(
    "logical operators",
    cols = 1,
    rows = 1:10,
    rule = "OR($A1=1,$A1=3,$A1=5,$A1=7)"
)
```

## 11.17 (Not) Contains Blanks

```
wb$add_worksheet("contains blanks")
wb$add_data(x = c(NA, 1, 2, ''), colNames = FALSE, na.strings = NULL)
wb$add_data(x = c(NA, 1, 2, ''), colNames = FALSE, na.strings = NULL, startCol = 2)
wb$add_conditional_formatting(cols = 1, rows = 1:4, type = "containsBlanks")
wb$add_conditional_formatting(cols = 2, rows = 1:4, type = "notContainsBlanks")
```

## 11.18 (Not) Contains Errors

```
wb$add_worksheet("contains errors")
wb$add_data(x = c(1, NaN), colNames = FALSE)
wb$add_data(x = c(1, NaN), colNames = FALSE, startCol = 2)
wb$add_conditional_formatting(cols = 1, rows = 1:3, type = "containsErrors")
wb$add_conditional_formatting(cols = 2, rows = 1:3, type = "notContainsErrors")
```

#### 11.19 Iconset

```
wb$add_worksheet("iconset")
wb$add_data(x = c(100, 50, 30), colNames = FALSE)
wb$add_conditional_formatting(
   cols = 1,
   rows = 1:6,
   rule = c(-67, -33, 0, 33, 67),
   type = "iconSet",
   params = list(
      percent = FALSE,
      iconSet = "5Arrows",
      reverse = TRUE)
)
```

## 11.20 Unique Values

```
wb$add_worksheet("unique values")
wb$add_data(x = c(1:4, 1:2), colNames = FALSE)
wb$add_conditional_formatting(cols = 1, rows = 1:6, type = "uniqueValues")
```

# 11.21 Sparklines

```
sl <- create_sparklines("Sheet 1", "A3:K3", "L3")
wb <- wb_workbook() %>%
   wb_add_worksheet() %>%
   wb_add_data(x = mtcars) %>%
   wb_add_sparklines(sparklines = sl)
```

# 12 charts

The following manual will present various ways to add plots and charts to openxlsx2 worksheets and even chartsheets. This assumes that you have basic knowledge how to handle openxlsx2 and are familiar with either the default R graphics functions like plot() or barplot() and grDevices, or with the packages {ggplot2}, {rvg} or {mschart}. There are plenty of other manuals that cover using these better than we could ever tell you to.

```
library(openxlsx2) # openxlsx2 >= 0.4 for mschart and rvg support
## create a workbook
wb <- wb_workbook()</pre>
```

#### 12.1 Add plot to workbook

You can include any image in PNG or JPEG format. Simply open a device and save the output and pass it to the worksheet with wb\_add\_image().

```
myplot <- tempfile(fileext = ".jpg")
jpeg(myplot)
print(plot(AirPassengers))
#> NULL
dev.off()
#> pdf
#> 2

# Add basic plots to the workbook
wb$add_worksheet("add_image")$add_image(file = myplot)
```

## 12.2 Add {ggplot2} plot to workbook

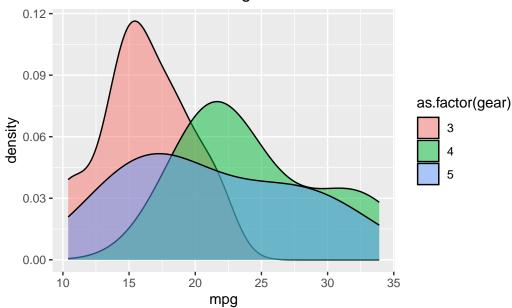

You can include {ggplot2} plots similar to how you would include them with openxlsx. Call the plot first and afterwards use wb\_add\_plot().

```
if (requireNamespace("ggplot2")) {
library(ggplot2)

print(ggplot(mtcars, aes(x = mpg, fill = as.factor(gear))) +
    ggtitle("Distribution of Gas Mileage") +
    geom_density(alpha = I(.5)))

# Add ggplot to the workbook
wb$add_worksheet("add_plot")$
    add_plot(width = 5, height = 3.5, fileType = "png", units = "in")
}
#> Loading required namespace: ggplot2
#> Loading required namespace: testthat
```

## 12.3 Add plot via {rvg}

If you want vector graphics that can be modified in spreadsheet software the dml\_xlsx() device comes in handy. You can pass the output via wb\_add\_drawing().

### 12.4 Add {mschart} plots

If you want native open xml charts, have a look at {mschart}. Create one of the chart files and pass it to the workbook with wb\_add\_mschart(). There are two options possible. 1. Either the default {mschart} output identical to the one in {officer}. Passing a data object and let {mschart} prepare the data. In this case wb\_add\_mschart() will add a new data region. 2. Passing a wb\_data() object to {mschart}. This object contains references to the data on the worksheet and allows using data "as is".

```
if (requireNamespace("mschart")) {
  library(mschart) # mschart >= 0.4 for openxlsx2 support

## create chart from mschart object (this creates new input data)
mylc <- ms_linechart(
  data = browser_ts,
  x = "date",
  y = "freq",
  group = "browser"</pre>
```

```
)
wb$add_worksheet("add_mschart")$add_mschart(dims = "A10:G25", graph = mylc)
## create chart referencing worksheet cells as input
# write data starting at B2
wb$add_worksheet("add_mschart - wb_data")$
  add_data(x = mtcars, dims = "B2")$
  add_data(x = data.frame(name = rownames(mtcars)), dims = "A2")
# create wb_data object this will tell this mschart
# from this PR to create a file corresponding to openxlsx2
dat <- wb_data(wb, dims = "A2:G10")</pre>
# create a few mscharts
scatter_plot <- ms_scatterchart(</pre>
 data = dat,
 x = "mpg",
  y = c("disp", "hp")
bar_plot <- ms_barchart(</pre>
 data = dat,
 x = "name",
  y = c("disp", "hp")
area_plot <- ms_areachart(</pre>
 data = dat,
 x = "name",
  y = c("disp", "hp")
line_plot <- ms_linechart(</pre>
 data = dat,
 x = "name",
  y = c("disp", "hp"),
  labels = c("disp", "hp")
```

```
# add the charts to the data
wb <- wb %>%
  wb_add_mschart(dims = "F4:L20", graph = scatter_plot) %>%
  wb_add_mschart(dims = "F21:L37", graph = bar_plot) %>%
  wb_add_mschart(dims = "M4:S20", graph = area_plot) %>%
  wb_add_mschart(dims = "M21:S37", graph = line_plot)

# add chartsheet
wb <- wb %>%
  wb_add_chartsheet() %>%
  wb_add_mschart(graph = scatter_plot)

}
#> Loading required namespace: mschart
```

## 13 Pivot tables

```
wb <- wb_workbook()$</pre>
  add_worksheet()$
  add_data(x = esoph)
df <- wb_data(wb)</pre>
wb$add_pivot_table(df, rows = "agegp", cols = "tobgp", data = c("ncontrols"))
wb$add_pivot_table(df, rows = "agegp", data = c("ncontrols", "ncases"))
wb$add_pivot_table(df, rows = "agegp", cols = "tobgp", data = c("ncontrols", "ncases"))
wb <- wb_workbook()$</pre>
 add_worksheet()$
  add_data(x = mtcars)
df <- wb_data(wb)</pre>
wb$add_pivot_table(df, dims = "A1", rows = "cyl", cols = "gear", data = c("disp", "hp"))
wb$add_pivot_table(df, dims = "A10", sheet = 2, rows = "cyl", cols = "gear", data = c("dis
wb$add_pivot_table(df, dims = "A20", sheet = 2, rows = "cyl", cols = "gear", data = c("dis
wb$add_pivot_table(df, dims = "A30", sheet = 2, rows = "cyl", cols = "gear", data = c("dis
## Pivot table example 1
wb <- wb_workbook() %>% wb_add_worksheet() %>% wb_add_data(x = mtcars, inline_strings = F)
df <- wb_data(wb)</pre>
# basic pivot table with filter, rows, cols and data
wb$add_pivot_table(df, dims = "A3", filter = "mpg", rows = "cyl", cols = "gear", data = "d
# same pivot table, but with "count" instead of "sum" and no style
wb$add_pivot_table(df, dims = "A10", sheet = 2, rows = "cyl", cols = "gear", data = c("dis
# nested pivot table with two variables for column, row and data and two different function
```

```
# uses an autoformatid (not that I like it, just because I can do it)
wb$add_pivot_table(df, dims = "A20", sheet = 2, rows = c("cyl", "mpg"), cols = c("vs", "gea
                   params = list(applyAlignmentFormats = "1",
                                 applyNumberFormats
                                                        = "1",
                                 applyBorderFormats
                                                         = "1",
                                 applyFontFormats
                                                         = "1",
                                 applyPatternFormats
                                                        = "1",
                                 applyWidthHeightFormats = "1",
                                 autoFormatId = "4099"))
# multiple filters on a pivot table
wb$add_pivot_table(df, dims = "A3", filter = c("am", "vs", "mpg", "hp", "wt"), rows = "cyl
# using custom caption
wb$add_pivot_table(df, dims = "A20", sheet = 3, rows = "cyl", cols = "gear", data = c("dis
# wb$open()
## Pivot table example 2
# pivot table with blanks and character variables on column and row
wb <- wb_workbook()$add_worksheet()$add_data(x = esoph)</pre>
